(Advertisements continued on p. 43)

Mr. THERM (of Harley St) **says:**

'Gas fires keep you warm, but leave the air cool and fresh!'

The ideal fire would be one which had no effect on the air which surrounded you, but warmed your body through and through (in much the way that the sun does in winter in Switzerland) A modern gas fire comes near that ideal, because it warms very largely by radiation It emits an unusually large proportion of the shorter infra-red rays — the rays that are so beneficial because they penetrate without scorching A modern gas fire projects a comforting glow of warmth through the room, yet never overheats or dries the air And, of course, it keeps the air always on the move — actually changing the air in a room three or four times every hour

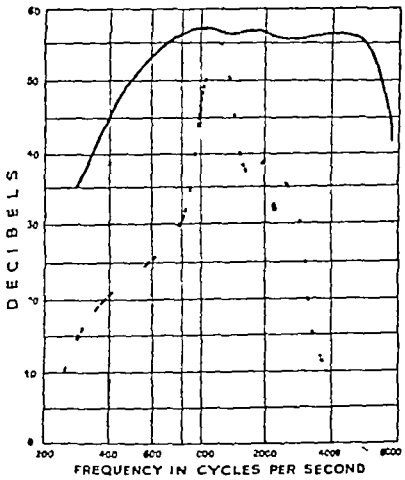
NEW!

The Friston Auriscope

WITH BLACK MOULDED BAKELITE SPECULA

having unique advantages of being practically unbreakable, never feeling cold to the patient, having no plating to wear or peel off, of special material to permit sterilising by thermal or chemical means and, being black inside, eliminating glare into the user's eye The new shape allows greater internal space for manipulation

The Friston Auriscope of outstanding design is robust and inexpensive, and it fits into an ordinary battery handle



Gowlland

electric diagnostic instruments

MADE IN ENGLAND

OBTAINABLE FROM ALL SURGICAL INSTRUMENT DEALERS

DISTORTION IN DEAF AIDS

The poor results given by the ordinary electrical hearing aid consisting of a microphone earphone and dry battery are due to noise in the carbon granule microphone and to frequency and amplitude distortion

AMPLITUDE DISTORTION means the unequal amplification of sounds of different intensity Weak sounds are not amplified loud sounds overload the instrument. FREQUENCY DISTORTION means the unequal amplification of sounds of different frequency

The broken line curve in the illustration shows the amplification of micro-telephone aid amplifying only about 1 000 cycles per second The continuous line curve shows the amplification of an Amplivox high fidelity aid giving uniform amplification over a wide frequency range

The presence of distortion in a hearing aid means loss of clarity and strain to the user In severe cases the distortion is reflected in the speech of the user

In Amplivox high fidelity hearing aids employing the piezo electric crystal microphone and the new midget valves these forms of distortion are practically eliminated and there is no background noise

Quite apart from the excellent results obtained the effect of use is to re-educate the hearing and to improve the mental appreciation of sound

Details of Amplivox high fidelity hearing aids will be gladly sent on request to —

THE AMPLIVOX is obtainable in the United Kingdom only from AMPLIVOX LTD and from Messrs. T Hawksley Ltd and W H. Pettifor Representatives are available in Australia Denmark, France Holland the I.F.S. India and Norway

Practical Applications of the

KAYLENE-OL

Treatment

CHRONIC COLITIS

(Simple Mucous, Muco-Membranous, Post-Dysenteric)

(Kaylene Brand of Colloidal Kaolin with highly viscous liquid paraffin)

Alternating intervals of constipation and diarrhoea often occur in cases of colitis Kaylene-ol is applicable in either phase Its soothing and adsorptive actions combat the irritative diarrhoea, and its softening and lubricating actions counteract constipation during the intervals

DOSE—KAYLENE-OL 1 or 2 dessertspoonsful three times a day, half hour before meals, or in mild cases half hour before breakfast and at bedtime

Kaylene-ol c Phenolphthalein (0·5 per cent) is taken when constipation is particularly troublesome Dosage as for Kaylene-ol

Samples and Literature from the sole manufacturers

KAYLENE LIMITED, WATERLOO ROAD, LONDON, N.W.2.

OVALTINE

GODDESS NEITH
Personification of watery Abyss which was endowed with self creation

M 278

IN SICKNESS AND CONVALESCENCE

THE impairment of digestive powers which is commonly met with in the feverish patient combined with the lack of desire for food, often aggravates the difficulty of adequately replacing the increased loss of energy and destruction of tissue which occur

Ovaltine provides a satisfactory solution to the problem of alimentation in many cases of sickness and in the stage of convalescence after severe, prolonged and debilitating illnesses where an easily assimilable palatable and concentrated nutrient is required It is always acceptable

Ovaltine replaces with advantage the ordinary milk preparations which so often prove distasteful to the invalid Prepared from full-cream milk, eggs and malt extract in carefully balanced proportions, it provides complete nourishment in the most readily assimilable form

Oral Vaccine for the prevention of Colds and Influenza

Since Genora brand Oral Vaccine was introduced to the Medical Profession last Winter, extensive clinical and laboratory tests have shown that it establishes a high degree of immunity against colds and influenza, the oral vaccine has also proved successful in the treatment of chronic bronchitis and similar respiratory infections.

This vaccine contains hæmolytic streptococci in addition to other organisms incriminated in the causation of coryza and influenzal infections It has been found that the ingestion of the oral vaccine against colds and influenza also develops immunity to diseases caused by hæmolytic streptococci

Particulars concerning Genora brand Oral Vaccine will be found in the new brochure on Vaccine Therapy which has recently been published by Genatosan Ltd. This booklet also gives information regarding a wide range of vaccines administered by hypodermic injection and the standard types of Local Immunity Products A copy of the brochure will gladly be supplied to any physician on request

Modern Iron Therapy

Iron 'Jelloids' are an elegant and reliable means of administering the protocarbonate of iron The preparation has none of the disadvantages of Pil Blaud The iron content remains fresh and unoxidized indefinitely, and injury to the teeth is avoided

The 'Jelloids' are highly effective in the treatment of achlorhydric anaemia and indeed in all the simple anaemias in which massive iron therapy is indicated

Iron Jelloids

You are cordially invited to apply for samples for clinical test

'PANOPEPTON'

WHAT IT CONTAINS

Contains in solution in an agreeable form, the entire nutritive constituents of beef and wheat

Contains all that is digestible in beef—in its juice and in its muscle tissues

Contains all that is digestible in wheat—its gluten, its carbohydrates

Contains all the savoury and stimulating elements, the extractives, the mineral constituents of beef and wheat

Contains these constituents in the soluble perfectly diffusible form into which they are converted in the process of normal digestion

USES OF 'PANOPEPTON'

Can be relied upon in cases where the nutrition of the patient is of prime importance

Has saved the patient in desperate straits due to intolerance of food

Has nourished and restored in cases of intolerance of other foods

Possesses remarkably restorative and stimulating properties

Is most nutritious most agreeable as a food at night against insomnia—exhaustion due to acute need of nourishment

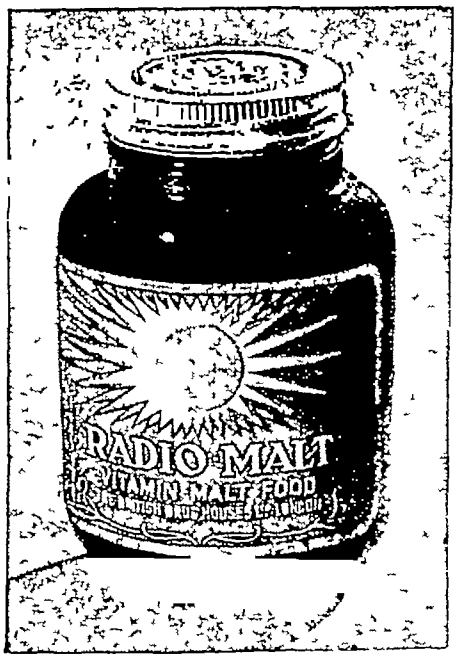
the scientific contraceptive

MIL SAN is a bland, non injurious, spermicidal jelly independent of variable physiological conditions of moisture or temperature. Since there is nothing to melt, dissolve or foam, MIL-SAN is immediately effective

The formula of MIL SAN is based on biological principles in harmony with the natural chemical and bactericidal balance of the vagina Its spermicidal efficiency is due to (a) A low pH secured by the reinforcing action of several acids which ensures the immediate immobilization and death of spermatozoa, despite the buffering action of the seminal fluid, (b) A low surface tension which causes the jelly to spread rapidly and to penetrate the rugae of the vaginal and cervical mucous membrane, (c) A degree of viscosity which ensures that it shall adhere to the cervix and upper vaginal tract and fornices, forming a chemical barrier preventing the penetration of spermatozoa into the os uteri

The method of applying the jelly is simple, hygienic, and proof against carelessness Each application of 7 c c is contained in a specially made strong glass tube sealed at one end with a cork, at the other by a hard wax plug In use the cork is removed, a bulb fitted behind the wax plug and the tube inserted Compression of the bulb forces the wax plug down the tube and ejects the contents The empty tube, which is thrown away, proves the application and ensures the quantity There is nothing to fill, nothing to clean Each application is hygienic and complete

MIL SAN does not deteriorate and is not affected by climatic conditions



There are no contra indications to the use of MIL SAN with a dependable condom or a properly fitted occlusive pessary It is only by such combined use that the consequences of misuse of one or other of the methods can be minimized and the maximum practicable security obtained

MIL-SAN

Literature setting out the ingredients and full particulars, together with a box of specimen tubes for examination, are sent on request to members of the medical profession

The du Maurier filter tip

stands for fitness . .

Smoking and fitness can be enjoyed together in du Maurier cigarettes Every trace of irritant that might worry a sensitive throat is trapped in the five layers of the filter tip No bits of tobacco can get past but all the full flavour of the Virginia tobacco comes through — cool and smooth and fragrant That holds good whether you prefer the cork tipped du Maurier (red box) or du Maurier medium with the plain tip (blue box)

du MAURIER

the perfect cigarette with the exclusive filter tip

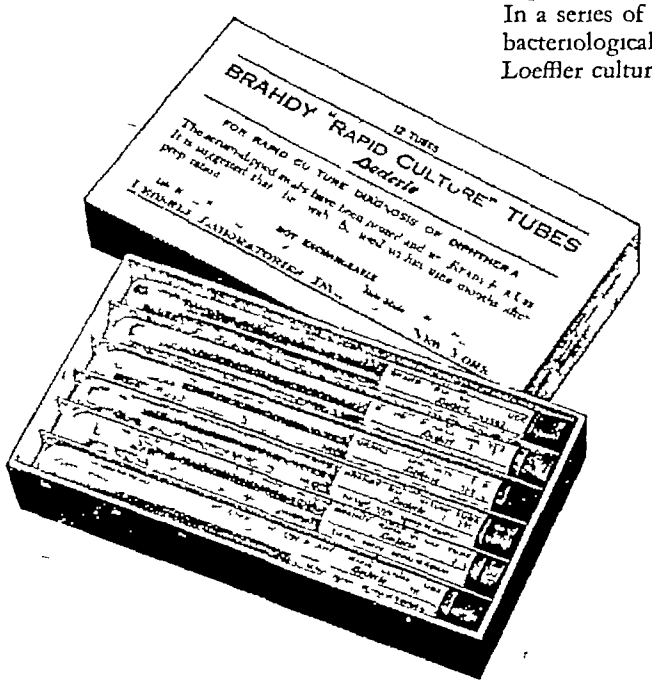
TEN FOR SIXPENCE—TWENTY FOR ONE SHILLING

Early diagnosis in diphtheria
by a rapid accurate method

BRAHDY "RAPID CULTURE" TUBES

Lederle

THE IMPORTANCE OF EARLY TREATMENT of diphtheria is so widely recognised that medical students are taught to administer antitoxin if there is even a clinical suspicion of diphtheria



In practice there is frequently a tendency to wait for a positive laboratory report confirming the clinical diagnosis of diphtheria before administering the antitoxin

When the use of antitoxin is thus postponed awaiting the bacteriological diagnosis of diphtheria, an accurate, rapid diagnostic method is invaluable

With BRAHDY "RAPID CULTURE" TUBES reliable identification of a diphtheria culture may be made within *four hours*

A swab may be used to take nose or throat cultures, returned to the tubes and incubated for four hours A culture taken in the home of the patient or in school may be ready to supply the answer by the time it reaches the microscope.

In a study conducted at the Willard Parker Hospital in New York City this rapid culture method was found more dependable than the 18-hours Loeffler culture method In a series of 74 cultures, this method gave 100 per cent bacteriological confirmations, as against 85 per cent for Loeffler culture

VEGETABLE PURÉES IN PEDIATRICS

A solution to the problem of home preparation

THE markedly improved nutrition and successful tolerance by infants to strained vegetables and fruits is rapidly securing a universal popularity for this dietary

In theory there is no more desirable way of meeting systemic acidity, nutritional anaemia and supplying dietary bulk for intestinal residue in a non-irritant form

In practice, however, defects in the home preparation of purées retard or defeat the end in view The vegetables used are not fresh, overmuch water or boiling in uncovered kettles reduces the mineral and vitamin content, and coarse sieving allows harsh fibre to pass

A typical example of the high nutritive values retained in Heinz Strained Foods (Figures show percentages on the wet basis)

In consequence there is a growing demand on the part of physicians and mothers for such a product that shall have the highest possible nutritive value, and complete uniformity Their attention having been drawn to this, the H J Heinz Company decided that here was a legitimate extension of their services in view of their wide buying resources and long experience in the preparation of foods

This company is accustomed to buying vegetables in those regions where they grow best, and to dealing with them within a few hours of their harvesting at the correct season of the year This last is, of course, highly important

The best factory practice is inevitably better than home preparation, however careful After scrupulous cleaning, for example, vegetables are cooked in the Heinz factories under light steam pressure with exclusion of air until just soft enough to be comminuted by extrusion and cutting The whole process is so regulated that the juices of the vegetables are retained throughout, there are no mechanical losses of mineral salts, vitamins or other soluble nutrients, and the resulting puree is adjusted to the proper consistence for satisfactory marketing

Before filling and sealing, the product is subjected to a process for the removal of any absorbed air, and sealing takes place *in vacuo* Finally, the sealed containers are immediately sterilised under known conditions of time and temperature. By these means are secured the high nutritional qualities, uniformity and convenience that physician, mother and patient desire

NOTE—Heinz Strained Foods are not packed in glass, for it has been found that light has an adverse action on vitamin content and palatability The containers have a special lining that eliminates possibility of metallic contamination.

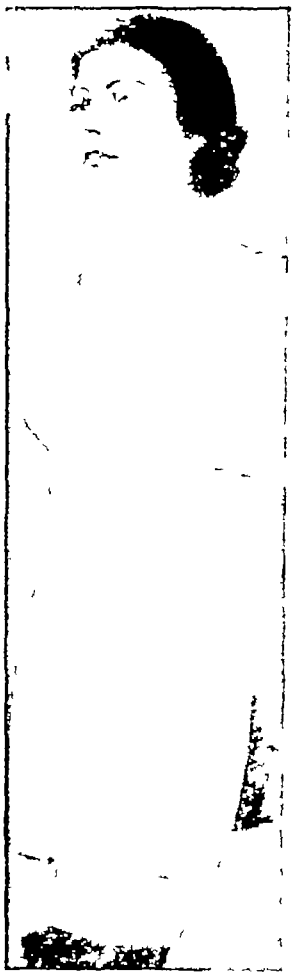
IN DISPLACEMENTS OF ABDOMINAL VISCERA Where Support is Needed

Spencer Supports gain patient's co-operation by providing exact fit, restful comfort and the correct design for the condition



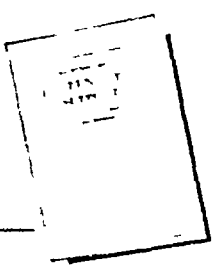
FOR such cases a Spencer Support is an accepted corrective measure. It affords relief by supporting the organs as nearly as possible in normal position, and in effecting a marked posture improvement.

Each Spencer Support is a special creation designed and made from the actual measurements and posture description of the individual patient. It unites accepted surgical principles and a style corset which ensures the best possible figure lines, saving the patient the expense of purchasing two garments. Therefore it is practical as well as economical to prescribe a Spencer.

The weight of the abdominal support in a Spencer is always on the pelvic girdle, not on the spine, at or above the lumbar region. Its exact fit anchors the garment securely to the patient's figure so that it will not ride-up or slip out of place.

Spencer Supports are individually designed for Breast Conditions, Hernia, Sacro-iliac Strain, Enteroptosis and Intestinal Stasis, Movable Kidney, Pregnancy and Postpartum Support.

They are exceptionally light in weight, flexible, easily laundered and guaranteed NEVER to lose their shape.



Spencer Supportive Corset. The fine tips at the front enable adjustment of the inner elastic band to perfect support of the breasts.

BEWARE OF SUBSTITUTION.—Spencer Corsets Ltd., realise the necessity of warning the medical profession that in several instances where specifically prescribed a Spencer Support, a corset of another make has been substituted and in each case its merits, as patterned through Spencer principles of individual designing, has been unsatisfactory. Every genuine Spencer Support bears the SPENCER label.

VICHY-CELESTINS

THE WORLD RENOWNED NATURAL MINERAL WATER

FERMENTATIVE DYSPEPSIA

When the secretion is vitiated in quality and the motricity of the stomach weakens that organ dilates, and the gastric stagnation allows the micro organisms of many ferments to develop Quite a series of acids are then to be met with (butyric lactic acetic etc) which not only irritate the mucosa but further after their passage into the intestine become absorbed by the lymphatics and swept into the circulation Vichy-Celestins, by its slightly stimulating action clears out the stomach and thus avoids stagnation and consequent *fermentation* As in addition to doing this it modifies stomachal metabolism the secretions return little by little to their normal physiological condition

OVOFERRIN

BRAND COLLOIDAL IRON TONIC

the rapid blood builder

It is estimated that the amount of iron in the entire body is not more than 3 gm When this small supply is diminished serious consequences develop Essential iron lost through hæmorrhage deficient food iron or other causes is quickly replaced by Ovoferrin

While all forms of iron are beneficial in anæmia, it is equally true that Ovoferrin presents the iron in a form that eliminates all the undesirable qualities of non-colloidal iron

Ovoferrin has unique advantages It is a rapid blood builder it does not stain the teeth it has an agreeable taste it is odourless it is not astringent it does not constipate it stimulates the jaded appetite it is tolerated by the most sensitive stomach it is readily taken by children

Ovoferrin has all the advantages of therapeutic iron without any of its disadvantages

The adult dose—a tablespoonful in a wine-glass of milk or water before or after meals—contains one grain of metallic iron in colloidal form held in that state by a protective protein colloid The dose for children is two teaspoonfuls Ovoferrin is prescribed in 11-ounce bottles

If you have not used Ovoferrin in your practice we shall be pleased to send you a trial bottle on request

THE PHYSIOLOGICAL VALUE OF THE BANANA

I. Carbohydrates: In the unripe banana starch predominates, and may be as high as 18 per cent, but in the fully ripe banana this has been converted into soluble sugars, and is reduced to about 3 per cent or less

This quantity is almost insignificant, especially since it has been noted ("Lancet" Laboratory Notes 1900) that the starch of the banana is more digestible than the cereal starches

The value of carbohydrates to the organism lying, as it does, in their caloric value, it should be noted that a pound of bananas yields 460 calories, as compared with 290 from the apple, and 240 from the orange.

The banana is, in fact, the highest calorie producer among ordinary market fruits

N.B In the fully ripe banana the soluble sugars evolved are approximately 9 per cent cane sugar and 4 to 5 per cent each of glucose and fructose A banana is ripe when all green has disappeared from the skin and brown spots have formed on the yellow surface

SEVENSEAS
COD LIVER OIL

is the only Palatable Liver Oil

with vitamin content standardised

in accordance with B.P. dosage

Cod Liver Oil well deserves its high reputation as a health-builder For it contains nature's vital Vitamins A and D in their right proportion It is the liver oil specifically named by the Ministry of Health and League of Nations Nutrition Committee. Its only drawback in the past has been its taste. But now we have overcome that. In "SevenSeaS" we have produced for the first time a pleasant palatable Cod Liver Oil, and it may be obtained in "High Potency" form too

"SevenSeaS" is obtainable in three forms (1) Standard B P Oil, (2) High Potency Oil — four times B P standard, (3) High Potency capsules containing 5 mm. dose of High Potency Oil We would like all practitioners to prove to their own satisfaction just how revolutionary "SevenSeaS" High Potency Cod Liver Oil is Please send to the address below for a free sample

VEGANIN BRAND TABLETS

Made in England

(probably a mixed and partly undiagnosed category), and seventy-four cases of psychoneurosis Out of the 1,031 cases no fewer than 275 were submitted to craniotomy, either for diagnosis or because their condition seemed to need it

If this be the mixed character of so large a proportion of patients admitted as cases of suspected intracranial tumour to a neurosurgical clinic, the absolute necessity for the presence in such a clinic of a trained clinical neurologist admits no denial Further, the various applications of radiography could not have sufficed to make a diagnosis in any of these 1,031 cases All they could have provided would have been the label "tumour suspect unverified," and this, of course, is not a diagnosis

The Problem of Early Diagnosis

One more point remains to be made The subject of our discussion is the *early* diagnosis of intracranial tumour, and it is important that we should be clear as to the way in which the problem presents itself to the general practitioner When the patient who ultimately proves to have such a tumour first comes to his doctor, the latter has to ask himself, not 'Has this man got a tumour, and if so where is it?' but a much larger question What is the matter with this patient?" The specialist is apt to forget that this question has been partially answered before he sees the patient A number of diagnoses have been ruled out, and the case comes to the neurologist as a presumptive case of nervous disease By the time it is referred to the surgeon the diagnostic issue has been still further narrowed, and a diagnosis of tumour has been made or suggested The diagnosis of intracranial tumour may therefore come to seem deceptively easy in its final stages Thus I read in a surgical account of intracranial tumour "The diagnosis of a space-occupying lesion within the skull is usually an easy matter Headache is the characteristic symptom"

Now let us examine this statement from the general practitioner's point of view Headache must be the commonest of all the symptoms of bodily ill health, and one of the commonest expressions of neurosis Even in a neurological clinic, from which many cases of headache have already been filtered off by the family doctor, headache is a principal symptom with at least half the patients who attend Of these only a minority have any organic affection, the majority being cases of neurosis or of migraine Only a tiny residue prove to be cases of tumour Therefore, for the general practitioner, and almost equally for the neurologist, to jump to the conclusion that every patient who complains of headache is likely to have an intracranial tumour would land them in innumerable absurdities and their patients in a succession of unnecessary alarms and diagnostic ordeals This single example will suffice to indicate how vitally necessary to diagnosis is wide clinical knowledge and sound judgement No amount of technical ingenuity will allow us to do without them

The Clinical Course of Intracranial Tumour

Passing now from the general to the particular we may say that the clinical course of an intracranial tumour is likely to follow one or other of the following four main lines of development

1 RECURRENCE OF GENERALIZED EPILEPTIFORM FITS

Generalized epileptiform fits are clinically indistinguishable in most instances from those of what we call idiopathic epilepsy For weeks and even months physical examination of the patient in the interval between fits may fail to elicit the presence of any abnormal physical signs whatever, while the patient may be equally free from abnormal subjective symptoms, such as headache When such fits first make their appearance in a middle aged individual who has been previously free from them they should always give rise to a suspicion of tumour, for this is probably the commonest cause of fits occurring in these circumstances I believe that fits so caused are rarely, if ever, nocturnal, but I should be interested to hear what others may have to say on this point

Focal, or Jacksonian, fits may also occur as the first or as a later developing symptom in tumour, but I believe that generalized fits—contrary to what is often supposed—are more common Conversely, recurrent focal fits of uniform character are not invariably associated with a macroscopic cortical lesion, whether tumour or a lesion of some other order, and the exposure of the relevant area of the cerebral cortex in the hope of finding one of an operable character is frequently negative in result

2 RAISED INTRACRANIAL TENSION

A more common mode of onset is that in which the signs and symptoms of raised intracranial tension develop—namely, headache sickness, and papilloedema While this headache rarely has any localizing significance, it often has features which may put us on the track of tumour Thus it often wakes the patient in the early hours of the morning, and is most severe at this time. When at its worst it is apt to be accompanied by vomiting, which in turn aggravates the headache It is not usually continuous the patient may enjoy hours or days of complete freedom, though in the terminal stage of a rapidly growing glioma it may be present for several days, fluctuating in severity and rising to peaks of frightful severity I have never been impressed by what is spoken of as the "projectile character' of cerebral vomiting, except in young children, who in any case are apt to be sick with unheralded suddenness

Slowing of the pulse is by no means a common sign, except in rapidly growing glioma One may find indications of grave rise of intracranial tension, but even in the final stage of the case the pulse may not fall in rate I believe that the rate of rise of intracranial tension is an important factor in the production of bradycardia Thus it is in my experience more frequently seen in subdural haematoma than in tumour As far as I have been able to determine it has no localizing significance, but when present it indicates marked intracranial hypertension

It is important to remember that a high degree of papilloedema may coexist with normal vision, or perhaps it might be more accurate to say with a degree of visual acuity which appears normal to the patient, though it may prove less than this on testing In the end failure of vision may occur with startling rapidity

It is perhaps surprising how severe may be the signs of raised intracranial pressure and yet no indications of the situation of the underlying tumour be obtainable, at least by clinical methods Yet we have to remember that a large tumour may be clinically entirely latent, being occasionally found as an unexpected post-mortem discovery In a fatal case of cerebral thrombosis with hemiplegia of my own, a previously apparently healthy man had but a few days illness before death Yet necropsy revealed the presence of a meningioma over an inch in diameter near the middle line in the parietal region

3 SLOWLY PROGRESSIVE LOCAL BRAIN LESION

Yet another mode of evolution is that in which we see the indications of a slowly progressive local lesion of the

Pernicious Anæmia Treatment

A study of the blood picture in pernicious anæmia makes it possible for the physician to assess the value of any particular form of treatment Experience has shown that, as a general rule, average cases respond to an initial injection of 2 c c of Anahæmin followed by 1 c c injections at ten-day intervals until the blood count has remained normal for a month For maintenance one injection monthly of 2 c c is usually sufficient

In very severe cases, however, as, for example, that described below, a much higher dosage may be necessary, but the end results are almost invariably the same — there is a speedy return of the blood count to normal and the patient is maintained thereafter in the enjoyment of full health by monthly injections

CASE HISTORY

Female 68 *years*	pallor, lassitude, anorexia, nausea, vomiting, giddiness, weakness and numbness of the legs Sleeping badly Losing weight.
On admission	T 100 2 P 100 R 23 B P 110/70
Treatment	31 8 37 2 c c of Anahæmin 1 9 37, 3 9 37, 5 9 37 and 10 9 37 2 c c. of Anahæmin, then twice weekly
Blood counts	1 9 37 Hb 25% r b c =1 2 millions per c.mm C.I =1 0 20 9 37 (21st day of treatment) Hb 65% r b c =3 6 millions per c mm C I =0 9
SUMMARY	In 7 days, and after 8 c c of Anahæmin, hæmoglobin rose from 25% to 45% In 14 days, after 10 c c of Anahæmin, Hb rose to 55% and the red cells in the smear showed very little abnormality

THE BRITISH DRUG HOUSES LTD LONDON N 1

An/B/33

We are to consider the *early* diagnosis of intracranial tumours By this I judge that as clinicians we mean a diagnosis closely following the first apparent symptoms, and at a *stage when disability from the disease is but* slight Obviously 'early" in this significance is a relative term A slowly growing tumour may be diagnosed early in this sense when it is identified in the fifth or tenth year of its actual existence The diagnosis of a rapidly growing tumour may be late in the fifth or tenth week of its life history

I desire to associate myself with all that Dr Walshe, who opens this discussion, has said in relation to the necessity for a good training in general medicine and a special training in neurology and psychiatry on the part of the diagnostician The elicitation of the history of the illness by 'informed and intelligent interrogation" is, in my view, the part of the examination requiring the greatest clinical acuity and experience Here the diagnostician s ability to elicit useful information and to assess *what reliance and what significance can be placed upon* the patient's statements is of enormous importance The physical examination of the patient, although it requires special knowledge and experience, is relatively easier to attain proficiency in The final step in the clinical diagnosis—the analysis of the facts of the history and observed signs and their synthesis into a comprehensive story and picture of the disease process—requires all the knowledge, experience, and intelligence we can muster If we do not bring an element of reasonably controlled imagination to bear on it we shall often fail Frequently in diseases associated with increased intracranial pressure a major element in this final stage of the clinical diagnosis is the distinction of those symptoms and signs due to the local effects of the disease from a host of others due to the effects of increased intracranial pressure and of displacements, distortions, and compressions of various parts of the brain and cranial nerves at a distance from the lesion

Although with Dr Walshe, and with all experienced in the diagnosis of disease of the nervous system, I regard pure clinical investigation as the first and principal factor in diagnosis, it is my business in this paper to discuss some of the special accessory methods of diagnosis which are available to us From long established use the more valuable and generally applicable of these special methods tend to creep into the routine of examination Thus the use of the ophthalmoscope at one time constituted a special examination But what should we think of a neurologist at the bedside without his ophthalmoscope in these days? Perimetry, I judge, is still considered something of a "special examination" in some quarters Yet the investigation of the visual function is hardly less important and should be as routine as that of motor or sensory functions Radiography has become almost a routine in the examination of patients suspected of harbouring a brain tumour It is a comparatively recent development, and may perhaps still be included in the group of special accessory methods Of the several special accessory methods of diagnosis I propose to refer to the following radiography, the examination of the cerebrospinal fluid ventriculography and encephalography, cerebral arterial radiography, and cerebral biopsy puncture

Radiography

As noted above radiography of the skull is a routine procedure following the clinical examination in patients suspected of possible intracranial tumour In general the pictures should be stereoscopic The views to be taken are dictated by the clinical facts The interpretation of radiographic findings is to be made by the neurologist with full knowledge of the clinical facts at his disposal It should be appreciated that a majority of x ray examinations made in pursuance of the early diagnosis of brain tumour yield no useful information, but that in the *minority* where significant changes are found they are of great value, and of such value that we cannot afford to omit this examination Radiologic findings, like clinical findings, may be grouped into (1) those indicating local disease effects, (2) those indicating brain displacements, (3) those showing the effects of increased intracranial pressure

Of *local* significance are calcifications within the *tumour, as may occur in tuberculomas, in certain gliomas,* in pituitary epidermoid tumours, and occasionally in meningiomas, angiomas, and aneurysms It is usually possible in these cases, in addition to observing the site of the lesion, to deduce its exact pathologic type from its situation and the form and texture of the calcific deposit Where certain tumours, notably the meningiomas, make contact with the skull bones we may observe a localized erosion or hyperostosis and an enlargement of the diploic venous channels and meningeal vascular grooves in its vicinity Other tumours by their local pressure on contiguous bony structures reveal themselves radiologically, such are pituitary tumours which distend the sella turcica, acoustic tumours which distend the internal acoustic meatus, and tumours of the optic nerves which may enlarge the optic canal

Significant of *cerebral displacement* is the "pineal shift" In a majority of normal adults the pineal body contains sufficient calcific deposit to be seen in a good radiograph A shift of this structure from its normal median position indicates a space occupying lesion in one side of the skull Occasionally calcific plaques are present in the falx cerebri, and their shift from a median position is equally significant

The earliest radiological evidence of *increased intra cranial pressure* is decalcification of the posterior clinoid processes It is seen especially in connexion with slowly developing lesions It may proceed to enlargement of the sellar cavity and to complete decalcification of its outlines In children widening of the coronal, interparietal, and lambdoid sutures is an early sign of cranial distension Decalcification of the inner table of the skull generally with accentuation of its digital markings may be seen later

Examination of the Cerebrospinal Fluid

The fluid is usually obtained by lumbar puncture This procedure is safe enough in patients who do not show evidence of increased intracranial pressure In those who do there is a possibility of aggravating cerebral impaction in the foramen magnum or in the incisura tentorii—an accident which may rarely cause an alarming access of symptoms Such cases, therefore, should be lumbar-punctured only in circumstances where immediate operation could be proceeded with if necessary I think this risk, though real enough, has been somewhat overemphasized, and much useful information has been lost through fear of lumbar-puncturing The lumbar puncture should be done only by or under the direction of the neurologist those unfamiliar with nervous diseases will fail to obtain full value through lack of knowledge of the data to be sought from it Like radiographic examination, investigation of the cerebrospinal fluid often shows no departure from normal in early brain

Where *easy* digestibility *is imperative*

Brand's Essence is not an *extract* but a pure *essence* of chicken or beef which precipitates no solids during digestion and contains no added salt or seasoning It stimulates a copious flow of gastric ferment, yet keeps highly competent control of the free acid, through absorption by the proteins at all digestive stages Brand's can be used safely even in cases of gastric ulcer

BRAND'S CHICKEN OR BEEF ESSENCE

is never contra-indicated

BRAND & CO LTD. SOUTH LAMBETH ROAD, LONDON, S W 8

area of brain surface exposed on incising the dura may yield useful knowledge An unusually dry cortex will suggest underlying tumour A profuse discharge of fluid from the subarachnoid spaces over the brain surface will suggest chronic diffuse serous meningitis as opposed to tumour The consistence of the brain is noted as the cannulae are passed through it The experienced operator will appreciate enlargement of the ventricle by meeting it more superficially than normal or its displacement from its normal position He will note the character, quantity, and freedom of fluid flow from each ventricle Occasionally differential examination of the fluid from each ventricle for total protein, cell content, and colour may give information of value As the gas replacement is being carried out the freedom of communication between the ventricles will be noted As a rule, except in cases of very extensive hydrocephalus, the ventricular fluid is replaced by gas as completely as possible

Stereoscopic radiographs are taken with great care as to accurate positioning of the head In interpreting the radiographs it should be borne in mind that the dural partitions within the skull are relatively rigid and thus a tumour in one side of the head causing displacement of the brain to the opposite side tends to crowd it through the archway beneath the falx, and the ventricular displacement follows this trend A tumour within a ventricle or close to it may produce unmistakable shadows or local distortions Symmetrically distended lateral ventricles, with indentations of their floors over the third ventricle, and absence of air in the latter, may indicate a tumour within the third ventricle Equal distension of lateral ventricles and of the third ventricle indicates an obstructive lesion in the posterior fossa Symmetrical hydrocephalus with a well-filled fourth ventricle may indicate an adhesive blockage at the roof of the fourth ventricle as opposed to tumour Deformation of the fourth ventricle may indicate a tumour of the cerebellar vermis or a laterally situated tumour in the posterior fossa If in the presence of increased intracranial pressure the ventricles appear normal, and gas escapes freely from them and accumulates in excess in the subarachnoid spaces over the brain surface, a diagnosis of diffuse serous meningitis can be made with confidence Multiple tumours may produce appearances difficult of interpretation, though with experience and ingenuity their significance may be assessed Important fallacies in interpretation are asymmetry of the skull with associated anatomical asymmetry of the ventricles, and incomplete and apparently capricious filling of certain parts of the ventricles It requires familiarity with the method to evaluate these fallacies

It will be appreciated that while ventriculography is of the greatest value to the patient when judiciously made and assessed, it should be employed only by a competent neurological diagnostician after the most careful consideration and when arrangements actually exist to operate immediately afterwards It is only in these circumstances that its abuse can be avoided and that full value can be obtained from it for the patient

Media other than air or oxygen have been tried for ventriculography Gas, as such is not diffusible in fluid, and a diffusible substance has great advantages in better permeating throughout the ventricular spaces Thorotrast is the most promising diffusible substance so far advocated but we find the advantages of its diffusibility outweighed by its more irritative qualities and by the fear that its permanent contact with the brain tissues may be damaging, for it cannot always be removed completely and it is not absorbed by the tissues We have, however, used thorotrast with great advantage in outlining pathological cysts in the brain radiographically, and in the ventricles in specially selected cases

Encephalography

Encephalography consists in replacement of cerebrospinal fluid by air or oxygen by lumbar puncture With the patient sitting leaning forward, or lying prone with head well raised, the gas can often be caused to enter the ventricles in addition to the subarachnoid spaces of the head A reasonably constant filling of the ventricles can be obtained in cases without increased intracranial pressure, but in those with increased pressure the filling is often unsatisfactory by reason of compression at the foramen of Magendie Gas in the subarachnoid spaces causes much more discomfort than it does in the ventricles, and with encephalography a large proportion of the gas injected goes into the former Further, one has not the advantage of making the valuable observations incidental to ventricular puncture As encephalography is relatively unreliable and is more distressing to the patient, we employ it only in specially selected cases, and in general prefer ventriculography We occasionally supplement a ventriculography by gas injection into the theca if there has been difficulty in getting enough air to enter or remain in the ventricles by the former method alone

Cerebral Vascular Radiography

Cerebral vascular radiography implies the injection of the arteries of the brain with a radio opaque medium and the visualization of the arteries and veins by x ray photography Thorotrast* is the medium employed, and it is usually injected into the internal carotid artery in the neck on the side of the suspected lesion The vertebral artery and its branches have been similarly visualized A photograph taken in the early phase of the injection reveals the arteries only, while an exposure some seconds later shows the veins and dural sinuses It is necessary to expose the carotid artery in the neck by open operation Local anaesthesia is usually satisfactory In relation to tumours the displacement of arteries by the mass of the tumour yields information similar to that gained by ventriculography The arterial displacements around a tumour may yield fuller and more intimate information of its exact extent and relations The ventricular picture tends to give wider information of anatomical conditions within the head and less detail of the tumour itself Study of the veins may provide very valuable evidence Many tumours are surrounded by a plexus or capsule of venous channels, and the actual outline of one of these vascular tumours may thus be seen Further, the vascular architecture in and around certain tumours may be sufficiently characteristic of the particular type to justify an opinion as to the actual pathology of the tumour from the phlebogram Angiomatous tumours whose blood spaces are in communication with the circulation can be very well demonstrated Although, in most of these, clinical signs together with the characteristic systolic bruit furnish a diagnosis of the nature and general position of the lesion, it is often desirable to define its exact outline more accurately for the purpose of directing therapeutic x-radiation

* The possible later injurious effects of thorotrast from its persistent radio activity are borne in mind So far no ill effects have been noted from the quantities we are accustomed to use, after ten years experience Brain tumour is a serious condition and seems to justify its use though one still feels hesitant in employing it in a young subject with good life prospects

Indicated in

CORYZA, CATARRH, RHINITIS, SINUSITIS, HAY FEVER, PHARYNGITIS, LARYNGITIS, ASTHMA, BRONCHITIS

MISTOL DROPS act as a local anæsthetic to the inflamed mucous membrane, thereby affording relief in all the distressing symptoms of common cold. The volatile substances contained in Mistol free the congested mucus, relieving the characteristic stuffiness and difficulty of correct breathing MISTOL is extensively prescribed in most acute conditions affecting the mucous membranes of the nose and throat.

Mistol

½ *oz bottles* 1/3, 2 *oz bottles* 2/6

½ *oz bottles* 1/3, 2 *oz bottles* 2/6

MISTOL with **EPHEDRINE** has been introduced as a preparation which, while exercising the soothing action of Mistol Drops will, at the same time, exert a vaso-constrictor action for chronic congestions It is important to note that the Ephedrine content has been limited to **0 57%** It is suggested that a greater content of Ephedrine would be liable to cause unpleasant sensations immediately after application.

THE BISEXUAL PROPERTIES AND CO-OPERATIVE ACTIVITY OF SEXUAL HORMONES AND THEIR EFFECTS ON FEMALES

BY

V. KORENCHEVSKY, M D

From the Lister Institute, London

Both female and male sexual hormones have been found in the female organism (Koch, 1936, Dingemanse, Borchardt, and Laqueur, 1937), and some have already been isolated in a pure form, while others, mostly those concerned in male activities, are as yet unidentified In the experiments we performed on rats two lines of inquiry were followed systematically—namely, examination of the bisexual properties of the sexual hormones and investigation of their co operative activity It is now possible to draw general conclusions Therefore in the present paper I propose to outline the results obtained at the Lister Institute in experiments some of which have already been published and some of which are unpublished, and also to discuss the possible clinical significance of these findings

The effects on the male and female sexual organs of the following pure sexual hormones and their derivatives were investigated androsterone (Korenchevsky, 1935, Korenchevsky and Dennison, 1935a, 1935c, and 1936, Korenchevsky, Dennison, and Levy Simpson 1935a) androstanediol and its water-soluble esters (Korenchevsky and Dennison, 1935b and 1936, Korenchevsky, Dennison, and Levy Simpson, 1935 and 1935a), testosterone (Korenchevsky, 1936, Korenchevsky and Dennison, 1936a, Korenchevsky, Dennison, and Browsin, 1936, Korenchevsky, Dennison, and Hall, 1937a), transdehydroandrosterone (Korenchevsky and Dennison, 1936b), Δ^4-androstenedione and Δ^5-androstenediol (Korenchevsky and Dennison, 1937, Korenchevsky, Dennison, and Eldridge, 1937 and 1937a), testosterone propionate (Korenchevsky and Dennison, 1937, Korenchevsky, Dennison, and Eldridge, 1937a, Korenchevsky, Dennison, and Hall, 1937 and 1937a), progesterone (Korenchevsky and Hall, 1937), and oestrone and oestradiol either alone or in combination with the hormones mentioned above (Korenchevsky and Dennison, 1934, 1934a, and 1935, and other references given above)

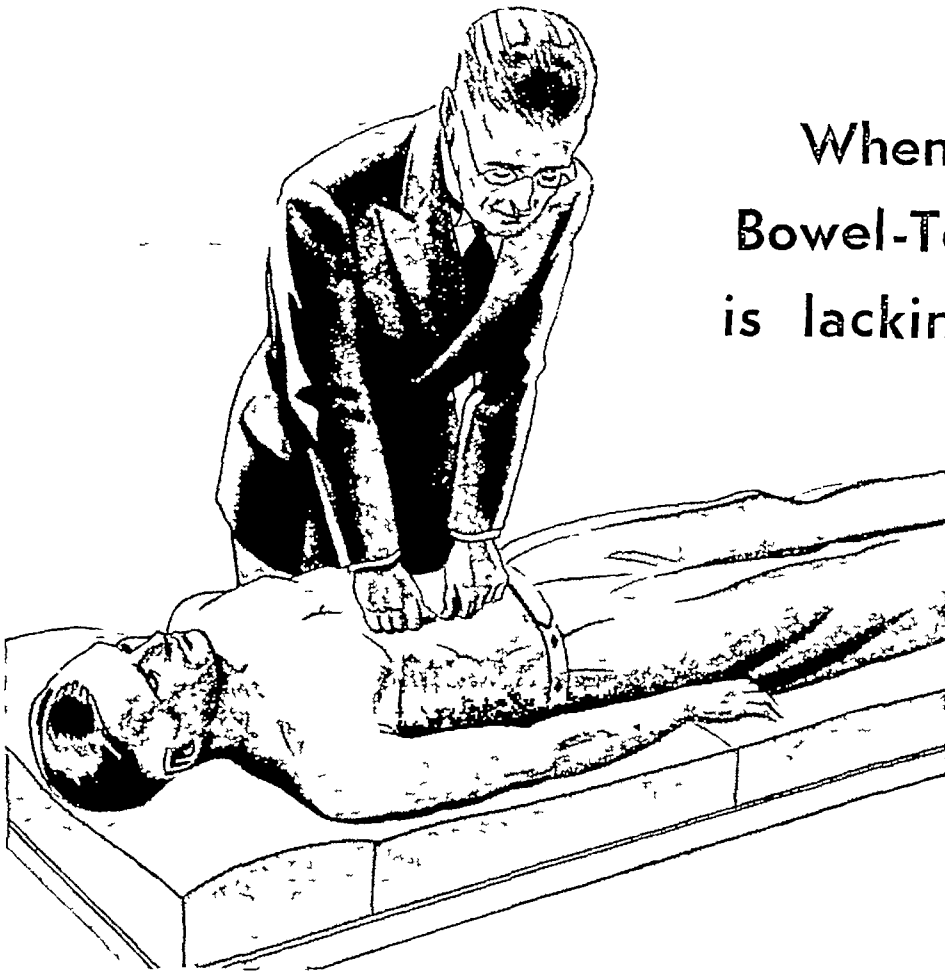
Of these hormones only androsterone transdehydroandrosterone, testosterone, and oestrone (Hausler, 1934, Girard,* 1937) have been found as such in the male, while dehydroandrosterone (Callow, 1936), progesterone (corpus luteum or pregnancy hormone), oestradiol, and oestrone have been found in the female Androstenedione and to a less extent androstenediol are regarded as possible intermediate links in the formation of the sexual hormones in the organism from cholesterol Testosterone propionate is of special interest and importance, since its activity is much greater than that of pure testosterone Some of the results obtained in our experiments were confirmed or independently obtained on rats or other animals by Collip and co workers (McEuen, Selye, and Collip 1936 and 1937, Selye McEuen, and Collip, 1936 Selye Browne and Collip, 1936), Ham (1937), Deanesly and Parkes (1936 and 1937), Klein and Parkes (1936) Robson (1936 and 1936a), and Zuckerman (1937)

* Personal communication

Technique of Investigation

The experiments were performed on 873 male and 437 female gonadectomized rats The individual effect of any sexual hormone injected can be demonstrated only in those animals in which the sexual glands have been removed, and in which, therefore, there is no interference or complication due to the action of the other sexual hormones secreted by the gonads The results obtained, however, were compared with those seen in 81 normal male and 109 normal female rats, though this comparison was made only in the case of some and not all of the hormones investigated In order to draw correct conclusions with regard to the atrophy, restoration to normal, or hypertrophy of the sexual organs the histological changes must be considered together with the changes in the weight of the organs For this reason the results obtained in our experiments were studied both by weighing the organs—that is by the "method of weights —and histologically The details of our technique have been given in previous publications (Korenchevsky, 1932, and in those mentioned above)

The hormones were dissolved in sesame oil, and injected subcutaneously twice a day for twenty to twenty-one days The daily doses, half of which was given at each injection, were as follows androsterone 450—3 600 γ, water-soluble androsterone, 13,600—27,000 γ androstanediol, 180—700 γ water-soluble androstanediol, 1,460—5,310 γ, testosterone 8—1,500 γ, testosterone propionate, 30—1,500 γ, dehydroandrosterone, 1,000—4 000 γ, androstenedione, 500—3,000 γ, androstenediol, 200—600 γ, and progesterone, 50—3,000 γ In most of the experiments oestrone and oestradiol were administered in doses of 1—30 γ three times a week, but in some experiments doses of 30 γ daily were injected In all the experiments in which progesterone and oestrone or oestradiol were combined, preliminary injections of 6 γ of oestrone were given on alternate days for ten to fourteen days before the combined hormones were injected



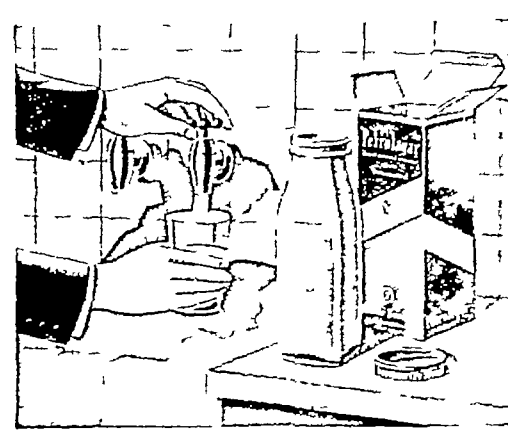
Bisexual Properties of the Hormones

These experiments on gonadectomized rats have established the fact that nearly all the sexual hormones investigated tend to a greater or less degree to restore to normal both the male and the female sexual organs which have atrophied as a result of gonadectomy a striking example is the most powerful of the male hormones, testosterone propionate This brings about a return to normal, or even to supernormal, of the atrophied sexual organs of castrated males The same hormone also restores the structure of the atrophied uterus and vagina of an ovariectomized female to a condition not far from normal while the weight of the vagina and the development of some of the tissues in this organ is even supernormal In normal rats it stimulates the development of the uterus and vagina to much above the normal size and weight

The sexual hormones investigated by us may be arranged in descending order of activity as stimulators of the development of the female sexual organs approximately as follows

1, 2. Oestradiol and oestrone
3. Testosterone propionate
4. Testosterone
5. Androstanediol
6. Androstenediol
7. Androstenedione
8. Transdehydroandrosterone
9. Androsterone
10. Progesterone

When these hormones are examined from the point of view of their co-operative activity this approximate order



When Bowel-Tone is lacking—

℞

'PETROLAGAR'

When the muscular condition of the bowel has become flaccid or otherwise impaired, 'Petrolagar' is invaluable in restoring bowel responsiveness and regular bowel movement

By supplying soft bulk, 'Petrolagar' brand paraffin emulsion affords more stimulation to the muscles, and the softness requires a smaller contraction wave to effect defæcation Thus by providing the proper fæcal consistency the bowel can readily be re-educated to function in a regular daily manner

PETROLAGAR LABORATORIES LIMITED
OLDHILL STREET, LONDON, N 16

week and 1,500 γ of progesterone daily Though the uterus and vagina showed typical histological progestational changes as a result of some of the combinations tried, both the size and the weight of these organs with all doses were considerably less than during pregnancy In fact, the uterus was much smaller even than that of the normal rat in dioestrus The bisexual hormones, especially testosterone and testosterone propionate, when combined with oestrone, produce progestation-like changes in the sexual organs of ovariectomized rats, while at the same time these organs hypertrophy considerably Taking these facts into consideration, various doses and combinations of testosterone, testosterone propionate, and androstenedione (150 γ to 500 γ daily) were added to the combination of progesterone and oestrone A greatly improved general development of the uterus and of the vagina resulted, as did progestational changes in the vagina approaching those seen in pregnant animals But while in the uterus the myometrium considerably increased, the progestational changes in the mucosa definitely decreased However, the degree of development of the uterus obtained in these experiments was still not identical with that of a natural "sterile pregnant" horn, and we are therefore continuing our experiments in an endeavour to reach this goal The degree of development of the vagina, on the other hand, was exactly similar to that of the normal 'pregnant' vagina

GROUP V

Group V comprised combinations of hormones producing normal oestrus In our previous papers and in our present experiments we have found that oestrone and oestradiol do not produce typical changes in the uterus (distension of the uterus) in ovariectomized rats, and that even in the vagina the changes obtained are not absolutely identical with those seen during natural oestrus in normal rats We concluded, therefore, that a combination of oestrone or oestradiol with one or more other hormones was responsible for the production of natural oestrus Up to the present we have failed to find such a hormone among those which we have examined Some approach to the 'oestrus' uterus" (considerable distension) was obtained when oestrone was combined with Δ^4-androstenedione, but this change was only obtained in some of the injected animals and the vaginal changes were atypical Kaufmann (1935) suggested that the co-operative activity of oestrone and progesterone was sufficient to produce normal menstruation in women, but this combination failed to produce typical oestrus in ovariectomized rats

Physiological and Pathological Properties

Among the actions of the "chiefly male" and the "true bisexual' hormones the more or less pronounced hypertrophy of, and the restoration changes in the structure of, the uterus and vagina atrophied as a result of ovariectomy must be regarded as physiological effects Another physiological feature of these hormones is their co-operative activity with oestrone and oestradiol Their pathological properties are evidenced by the deficient quantitative effect of the hormones (incomplete return of the atrophied organ to the normal weight, size, and structure), and by their deficient qualitative effects, in that the changes they produce do not correspond to those seen at any phase of a physiological sexual cycle In some instances the vagina would be typical of one period of the sexual cycle and the uterus typical of another In general it may be stated that with most of the hormones investigated both quantitative and qualitative pathological deficiencies were found more often and were more pronounced in respect of the changes produced in the uterus than of those in the vagina

Supernormal development of the sexual organs is also a pathological feature, and it was particularly striking in the uterus ('gigantic uterus") and to a less degree in the vagina when normal rats received injections of testosterone propionate The hypertrophy of the uterus greatly exceeded that seen in the sterile horn of a pregnant uterus The same superdevelopment was also seen in the vaginas of castrated rats injected with testosterone propionate either alone or in combination with oestrone or oestrone and progesterone The weights of these vaginas, however, were no greater than those of the vaginas of normal pregnant rats

Other pathological changes seen, more usually after the injection of large doses, were In the uterus, (1) irregular structure of the stroma of the mucosa, (2) vacuolation of the uterine epithelium, (3) mucous cystic enlargement of the glands, and (4) abnormally abundant development of the fibrous tissue of the myometrium In the vagina corresponding pathological changes were (1) deficient or more irregular mucification than that normally seen during pregnancy, (2) the persistence of a narrow epithelial layer in the otherwise normally developed progestational vagina, (3) the absence or only slight development of the cornification seen in normal oestrus and the presence of dropsical vacuolation with leucocytic invasion of the vacuoles and the spaces between the cells of the epithelial layer in some of the ovariectomized rats injected with oestrone or oestradiol

Great development of the clitoris (Korenchevsky, Dennison, and Eldridge, 1937 and 1937a), and of the prostate (Korenchevsky, 1935a and 1937, Korenchevsky and Dennison, 1936), in normal and ovariectomized rats injected with male hormones are features indicative of masculinization—that is, of a further pathological effect Hypertrophy of the female preputial glands (Korenchevsky and co workers, 1935–7) is also pathological

Clinical Significance

In the light of the facts given above an explanation may be advanced as to why treatment with oestrone or oestradiol alone often fails to give good therapeutic results when applied to diseases of the sexual organs and general endocrine sexual disturbances in women The activity of the corpus luteum hormone or hormones is not limited to the period of pregnancy, since false corpora lutea appear and persist for some time after each ovulation. Apart from pregnancy, therefore, this hormone (or perhaps hormones), although secreted in much smaller amount than is the case with the fully developed corpora lutea, should produce some special effect if it is combined with the oestrogenic and other hormones Kaufmann (1935) produced evidence of the successful treatment of some gynaecological cases by the combined administration of oestrone and progesterone

It is most improbable that the presence of male compounds in the female organism is without significance or without effect on the sexual and other organs and functions, there can be no doubt that they also play an important part in the general endocrinological co operative and antagonistic activities in the female organism It follows that the endocrine treatment of diseases of women cannot be perfected until (1) the male sexual hormones present in females have been isolated and identified, (2) a thorough experimental investigation of the physiological and pathological properties of these hormones, alone and

A major operation in progress in the operating theatre of a London Hospital

THE LESSON OF ANTISEPTICS

LISTER S discovery that suppuration of wounds was caused by bacterial infection and could be prevented by the use of antiseptics opened the way to the marvels of modern surgery To-day it is taken for granted that every operation will be carried out without the introduction of micro-organisms into the blood

Recognition of the importance of germ-free cleanliness however is no longer confined to the operating theatre and surgery it receives ever-increasing attention from the lay public. Health standards to-day are higher than they have ever been as a result Naturally elaborate precautions against infection are impracticable in everyday life, but fortunately adequate protection is provided by the liberal use of soap and water—provided that the soap is pure and has antiseptic qualities

Wright s Coal Tar Soap has enjoyed the confidence of the medical profession for over 70 years Leading bacteriologists advocate its use for everyday protection against infection and it has been found that more doctors use Wright s than any other brand of toilet soap Wright s has substantial antiseptic and antipruritic qualities and is the only soap to contain liquor carbonis detergens (Wright s), the valuable skin therapeutic used and recommended by the foremost dermatologists You can use and recommend Wright s Coal Tar Soap with every confidence.

WRIGHT'S COAL TAR SOAP

The Safe Soap

Wright Layman & Umney Ltd., 44 50 Southwark Street S.E.1

from headaches, 39 per cent from giddiness, and r cent from nervous instability Obesity occurred per cent, while 23 per cent suffered from rheumatic ins, 10 3 per cent were incapacitated for a varying of time

Factors bearing on Menopausal Symptoms

The severity of menopausal symptoms would appear to depend upon several factors As in the case of other endocrine disturbances, such as those which occur at adolescence or during pregnancy, it would seem that those individuals who tend by nature to be "highly strung" are more prone to develop functional manifestations From the prognostic point of view it is wise to distinguish between symptoms which originate at the menopause and those accentuated by the menopause Thus of the first fifty patients treated by me eighteen had suffered from functional symptoms—that is, headaches, nervousness, dyspepsia, insomnia, muscular rheumatism, etc—in varying degree since adolescence Of these eighteen a hereditary tendency could be traced in fourteen To this constitutional factor is related the undoubted influence of race Fifteen of these fifty patients treated were Jews, and the oestrin dosage necessary to control their objective signs (tachycardia, hypertension, oedema, arthritis, etc), together with the duration of the treatment, was on the average nearly twice as great as in a similar group of English subjects

The duration of menopausal symptoms is subject to as much individual variation as their severity In the majority of cases compensation usually occurs in two years In many instances functional disturbances, such as flushes, may persist for as long as ten years, and in certain individuals these disturbances would appear to be permanent This latter conclusion is supported by the persistence in many individuals of a high gonadotropic urinary excretion into old age, and also by the successful response to oestrin therapy of symptoms which originated thirty years previously at the climacteric In several cases I have noticed the slow, insidious onset of typical menopausal symptoms in women between the ages of 55 and 60 who had apparently passed through a quiet menopause five to ten years previously Anxiety states and moderate hypertension are not uncommon in such subjects, and since these respond well to large doses of oestrin I am inclined to the belief that they may be late manifestations of the climacteric For the purpose of this review, however, no patients are included who were under 40 or over 55 at the commencement of treatment

The Complex Origin of Symptoms

The origin of menopausal symptoms would appear to be complex, and any detailed analysis would be irrelevant to the purpose of this paper A brief summary of my personal views is, however, necessary in order to justify the wide range of conditions which have received treatment In general I believe that any endocrine secretion possesses at least three distinct actions

1 A direct specific visceral effect, (In the case of oestrin, genital development)

2 Direct non specific effect upon the autonomic centres of the brain—Experimental and clinical observations suggest that the anterior pituitary the thyroid and adrenal medulla stimulate the sympathetic centres while the posterior pituitary, the parathyroids the islands of Langerhans and the secretions of the gonads stimulate the parasympathetic

3 The regulation of endocrine balance

For these reasons the effects produced by abnormal secretion of any individual gland must vary with the endocrine and psychic pattern of the individual Any reduction in oestrin secretion will be followed not only by local changes in the reproductive organs and a disturbance of endocrine equilibrium, but also by imbalance between the sympathetic and parasympathetic systems, leading to a predominant tonus of the former This latter manifests itself not only by psychic unrest and sleeplessness but also by disordered function of every organ and system

It is to be emphasized that no individual symptom so produced is specific for lack of oestrin Rather must they be regarded as the expression of a general neuro-endocrine disharmony, which may equally well result from a variety of endocrine, reflex, infective, metabolic, environmental, or other conditions The relative importance of oestrin lack in the production of symptoms—and hence the degree of improvement likely to follow oestrin administration—can only be judged when all such other factors have been evaluated or excluded In this connexion the subject of allergy deserves particular mention, since it is frequently acquired for the first time at the menopause, as in other states of neuro-endocrine disturbance Food allergy, particularly to egg albumen and milk, would appear to be especially common While suitable treatment, by exclusion or desensitization, must be given to any allergic state when present, it is my impression that tolerance for any particular allergen increases with the stabilization of the nervous state

During the last three years I have employed oestrin in ninety-four cases of menopausal disturbances, of whom fifty have now completed treatment Of these fifty the following were the principal complaints headache, 46 per cent, nervousness and depression, 46 per cent, insomnia, 38 per cent, abdominal pains, including mucous colitis, 26 per cent, flushes, 24 per cent, muscular rheumatism, 26 per cent, articular rheumatism, 18 per cent, vertigo and "falling," 20 per cent, palpitations, 18 per cent, oedema of ankles or arms, 10 per cent, petit mal, 6 per cent, grand mal, 4 per cent, pruritus vulvae, 6 per cent, leucorrhoea, 6 per cent, hypertension was found in 16 per cent While these figures cannot be regarded as representative, it is interesting to note the comparatively small number who complained of flushes

It will thus be seen that headaches, nervousness, insomnia, and abdominal pain are the commonest complaints Such symptoms, however, are only the grosser manifestations of the menopausal state Associated with them, or at times occurring independently, numerous other phenomena may occur which are remarkable for their great variety Some of these would appear to be due to autonomic discharge of central origin, others to peripheral or biochemical effects The close interdependence of the autonomic nervous system, endocrine glands, and circulating metabolites, however, clearly prohibits any clear-cut classification on such lines, and, moreover, is apt to stultify the effects of such symptomatic treatment as nerve section

The following is a brief description of some of the menopausal phenomena which have occurred in my series, together with specific case histories where relevant

1—*The Menopausal Psychoses*

These mostly take the form of irritability, depression, loss of confidence and mental exhaustion *In the severe states some pre existing and often hereditary tendency can often be demonstrated It is well, therefore, to emphasize* once again that oestrin treatment will only restore an individual to that state of health which was enjoyed before the onset of the menopause Tall, thin, hypo

muscularly and 2 mg by mouth each week Digitalis and sedatives were then discontinued Her condition has since remained stable for nine months on 0 3 mg oestrone by mouth daily There is now slow auricular fibrillation at 76, but no oedema and no dyspnoea She is doing full housework for the first time for four years

The superficial resemblance between menopausal and cardiac symptoms is worth noting Dyspnoea, palpitations, vertigo, and oedema of the ankles are common to both conditions, and in the presence of a chronic carditis the correct interpretation of symptoms is occasionally difficult In similar fashion the combination of the menopausal symptoms of headache, hypertension, retinitis, oedema of face and extremities, with frequent micturition, is apt to be mistaken for chronic Bright's disease I have observed two cases of intermittent claudication of the legs commencing at the menopause, both of which responded to treatment It is my impression, however, that this symptom is more characteristic of the male climacteric

It would seem that the wide range of rheumatic manifestations which characterize the climacteric may also have a vascular origin Under this group may be mentioned diffuse muscular rheumatism, periarticular arthritis —which may or may not be combined with synovial proliferation—and neuritis In the absence of any secondary allergic cause these conditions, in particular the periarticular form of rheumatism, respond most satisfactorily to adequate oestrin replacement My experience has shown that comparatively large amounts are required and that these must be continued over a minimum period of six months before satisfactory improvement is obtained

Case 5—This patient, aged 55 had had amenorrhoea at 48, with insomnia depression, and leucorrhoea For five years she has been confined to the house with rheumatism and was unable to climb stairs She was treated unsuccessfully with massage, vaccines and gold On examination gross periarticular thickening of knees was present with much synovial proliferation and coarse crepitation, there was also osteoporosis and narrowing of the joint space

After twelve months weekly administration of 2 mg oestradiol benzoate intramuscularly and 2 mg oestrone by mouth, the joints have returned to normal size and fine crepitations only can be elicited The patient can now go upstairs and walk a mile in comfort, but her knees are still somewhat stiff on resting. She sleeps well, has no leucorrhoea, and is enjoying life

3—Visceral Spasm

In addition to the irritability of the vascular system there would also appear to be an increasing irritability of all smooth muscle throughout the body Clinically this visceral irritability occurs more often perhaps in the splanchnic area, particularly when there is local irritation For this reason gall-stones, uterine fibroids, or renal calculi, which undoubtedly in many cases have been present for many years, may first give rise to symptoms at the climacteric In my series two cases of repeated and severe gall-stone colic occurring for the first time at the menopause in bronchitic subjects have responded well to adequate oestrin therapy

4—Functional Disturbance of the Gastro-Intestinal Tract

These functional changes are characteristic of overaction of the sympathetic system with the suppression of parasympathetic functions At the menopause symptoms due to spasm of the various sphincters—superior oesophageal cardiac, pyloric ileo caecal—are extremely common together with this there is usually a contraction of the iliac colon and a muscular atony of the body of the stomach and caecum Similar secretory disturbances accompany these motor changes, thus there is an inhibition of gastric acid secretion with the occurrence in many cases of true achylia, and an active secretion of mucus not only by the stomach but also by the colon It seems possible that these functional disturbances, and in particular the alteration in gastric acidity, may be responsible for the microcytic and even macrocytic anaemia which often occurs at this age

Of the patients in this series fifteen complained of symptoms due to splanchnic discharge In these cases it was unusual for the pain to be limited strictly to any one particular portion of the intestinal tract thus epigastric pain was frequently associated with left iliac fossa pain and a condition of mucous colitis Relief was given to all these patients by a combination of dietetic and oestrin treatment

5—Glandular

No cases of menopausal glycosuria have received treatment True hyperthyroidism is occasionally an accompaniment of the menopausal nervous state, and in three cases not included in this series considerable improvement followed the administration of oestrin before operation

My connexion with the Manchester Royal Eye Hospital has enabled me to observe the frequent occurrence of certain ophthalmic conditions at the menopause Two cases of choroiditis have been treated with disappointing results, four cases of persistent or recurrent iridocyclitis have shown dramatic improvement, and two out of three cases of occlusion of the central retinal artery have ultimately regained 6/18 vision

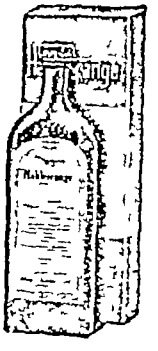
Two cases of pin-point vision have responded to oestrin therapy, the perimeter records and history of one of these being here recorded

Case 6—This patient, a married woman of 48, had a history of amenorrhoea for twelve months headaches and dizziness for twelve months, and failing eyesight for three months The administration of 0 3 mg. of oestrone daily by mouth was begun on April 7, 1936 Vision on April 19 corrected, right, 6/9 J8, left, 6/9 J8 Retested October 6 corrected right, 6 5 J1 left, 6/12 J1 The patient took her discharge on January 11, 1937, but returned on August 8 with slight recurrence of nervous symptoms

Certain other conditions have also appeared to respond well to treatment, but no opinion can as yet be formed owing to the natural tendency of these to undergo spontaneous remission Among this group may be mentioned certain types of disseminated sclerosis and encephalitis which first showed at the menopause

Some conditions would seem to be very resistant to oestrin therapy No improvement has, for instance, been made in cases of menopausal asthma and bronchitis which have been treated solely by oestrin Here the allergic factor would appear to be of greater importance, though it would seem that the development of the allergic state was facilitated by the neuro endocrine disturbance Low backache is also a common symptom which at times is difficult to relieve In some cases its persistence may indicate that the oestrin dosage is inadequate In two cases relief has only been obtained by the additional administration of corpus luteum hormone, one international unit of which has been given on alternate days

Symptomatic treatment has been reduced to the minimum In the early stages some sedative, such as luminal, prominal, or ergotamine tartrate, has been necessary to induce sleep, but in all cases it has been possible materially to reduce the drug and in many to discontinue



HALIBORANGE presents Allenburys tasteless and odourless Halibut-Liver Oil, associated with additional vitamin D and Allenburys Orange Juice

One teaspoonful of Haliborange is equivalent in vitamins A and D to one teaspoonful of cod-liver oil

Haliborange is an excellent addition to the diet of babies as a precaution against rickets and scurvy For older children, adolescents, or adults, it is a prophylactic vitamin tonic

Haliborange

In 5, 10 and 40 oz bottles

Descriptive literature will be sent on request

'Proctocaine' is a lasting, non toxic, local anæsthetic, for use in irritating or painful conditions of the skin and subcutaneous tissues. It is an improved form of A.B.A. 'Proctocaine' is a combination of oil soluble anæsthetics of low toxicity These are combined so as to produce *immediate local aæsthesia* which is maintained by the slow uniform absorption of its oily vehicle, and action of its oil soluble ingredients.

The advantages of 'Proctocaine" over other solutions have been found' to be as follows

1. Its effect is almost certain
2. It produces anæsthesia or hypo anæsthesia for periods varying from 7 to 28 days or longer
3. The relaxation which it produces in the anal musculature is much greater and more prolonged
4. It is comparatively non toxic, injection of 20 to 30 c.cm. producing no general effect.
5. Even large quantities of it at one sitting have not been found to produce any local reaction if injected properly
6. Its injection is painless if made slowly
7. In no case did it produce severe after pain

In two cases the intramuscular injection of an oily solution was followed within twenty-four hours by the appearance of an urticarial eruption, one following 1,000 international units of menformon and the other following an injection of 10,000 international benzoate units of progynon In neither of these cases did any reaction follow the oral administration of oestrone, and it is possible that the cutaneous eruption was an expression of sensitiveness to oil rather than to the hormone

Of great practical importance in the treatment of menopausal disturbances is the question of cost The price and activity of commercial preparations of oestrin show considerable variation In the above series the Organon preparation of oestrone (menformon) has been employed in pills of 0 1 mg (1,000 I U) and in oil solution containing 1 mg (10,000 I U) to the cubic centimetre, while larger doses have been obtained with progynon (Schering), 1 mg of oestradial benzoate (10,000 I B U) being contained in 1 c cm of sesame oil

The cost of initial treatment works out at about seven shillings a week for private patients A reduction of some 30 per cent is obtainable by hospitals The treatment of a hospital case of average severity will therefore amount to approximately £1 per month in oestrin alone

Since the menopause is directly or indirectly responsible for a great amount of suffering in any community the question of the responsibility of the hospitals for the provision of this treatment is immediately raised On the one hand it is true that the wholesale use of this remedy at present prices will soon involve even a small hospital in considerable financial expenditure On the other hand it is equally true that the menopause, though a relatively innocuous phase in the life of the average woman, is undoubtedly responsible in about 5 per cent of women for the onset of chronic ill health, permanent disablement, or even sudden death If untreated many of these unfortunates ultimately swell the medical and surgical waiting lists of hospitals, in which the cost of their board and lodging alone will amount to between £5 and £6 a fortnight Quite apart from this consideration, however, it would seem illogical for any hospital to deny its patients the established benefits of oestrin therapy while permitting the expenditure of equal sums of money on the treatment of many less sinister conditions It is to be hoped that the ingenuity of the organic chemist will in the near future provide a solution to this problem

Summary

In this article I have endeavoured to emphasize the importance of the climacteric in the production of a wide range of morbid conditions, and the unique value of substitution therapy in their correction I sincerely hope that its publication will stimulate a more general practical interest in this gratifying subject To those who are not yet familiar with the employment of oestrogenic substances I would stress again the following points

1 Selection of Cases—The use of oestrin does not obviate the necessity for the search and removal of non-endocrine factors At its best oestrin can only restore an individual to that state of health which was enjoyed before the onset of the climacteric

2. As with other endocrine treatment, the dose must be adequate for the requirements of the patient and treatment must be prolonged

I wish to express my appreciation and thanks to the Board of Management of the Manchester Northern Hospital for sanctioning the heavy expenditure incurred in the running of my endocrine clinic.

TREATMENT OF MENSTRUAL IRREGULARITIES BY A NEW SEX HORMONE PREPARATION

PRELIMINARY NOTE

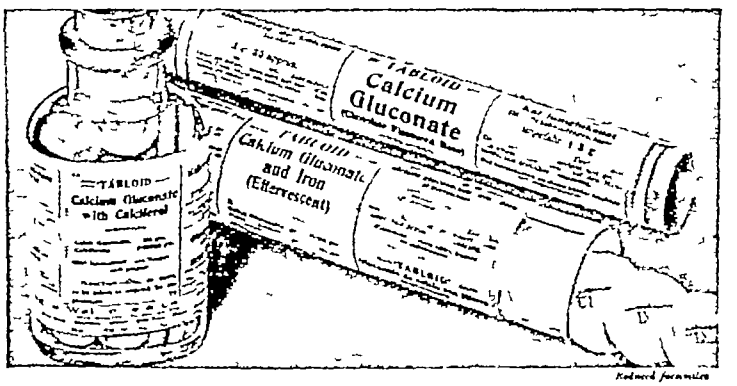
BY

KENNETH BOWES, M D., M S, F R C.S.

Obstetrician and Gynaecologist to Out patients, St Thomas s Hospital

Of recent years the advance of knowledge about the sex hormones has been immense, however, as Novak wrote, "the results of gynaecological organotherapy have been disappointing, while the accomplishments of gynaecological endocrinology have been numerous and brilliant" Kaufmann showed how, by large doses of oestrone and progesterone scientifically administered, a normal type of menstruation could be produced by substitution therapy The end-results of such treatment, because they depend on substitution, are in many cases disappointing, as menstruation fails to persist for long following cessation of injections It is therefore to the gonadotropic hormones that attention has now been focused with the aim of correcting menstrual irregularities from the regulator itself So far, whereas reliable luteinizing gonadotropic hormones have been made available for clinical use, there has been no corresponding follicle-stimulating hormone for therapeutic use Recently the opportunity has occurred to use a preparation called "antostab," which is claimed to have follicle stimulating properties

It is not within the scope of these notes derived from clinical material to discuss the experimental evidence in regard to the preparation, which is made from the serum of pregnant mares In animal experiments it has been shown to differ materially from the gonadotropic hormones derived from the urine during pregnancy, in that it produces follicle stimulation in immature rats to a very marked extent, thus corresponding more to the hormones of the hypophysis itself It is also capable of follicle stimulation in hypophysectomized rats, whereas the gonadotropic hormones of urine produce only luteinization The preparation has similar properties when injected in monkeys, producing marked increase in weight of ovaries Dosage is based on mouse units, one M U being the minimum quantity required to be injected to double the weight of the ovary of sexually immature three to four-weeks-old mice in three to four days In the following short series of cases two to three ampoules of antostab (100 M U per ampoule) were given weekly



From its properties it would appear that the preparation would be of most use in the treatment of amenorrhoea, and six consecutive cases of amenorrhoea, hypomenorrhoea, and oligomenorrhoea were given injections of antostab One of these cases has been excluded from the notes as a small mole was found to be the cause of the amenorrhoea It was expelled spontaneously after injections of antostab, probably owing to oestrone stimulation

Notes of Cases

Case 1—An unmarried woman aged 28 who had not had a period for ten years The periods had started at 15 and continued irregularly for two years and then stopped On examination the uterus was small (1¼ inches in length by probe) Injections were started and after four had been given there was a period, loss being slight, injections were continued, and a month later there was a period lasting three days During the next cycle a curettage was done on the twenty second day which showed endometrial changes corresponding to about the sixteenth day Secretion was present in the cells, but there

DIANA WAS A ROMAN HEALING GODDESS OF GREAT RENOWN. HER HEALING SPRINGS ATTRACTED PATIENTS FROM FAR AND WIDE. SHE IS HERE SHOWN IN HER OBSTETRIC ASPECT BEARING A TORCH – Diana was originally a wood-spirit and had some connexion with the moon. Her cult was brought to Rome about 500 B.C. and a temple was built to her on the Aventine Hill. Her renown as a magician caused her to be equated sometimes with Hecate. All her sanctuaries were centres of religio-medical treatment, especially the awe-inspiring shrine in its vast and solemn grove at Nemi. To this shrine came on pilgrimage women bearing torches and wreaths to beseech Diana Lucifera to grant them children and easy labour. Other sufferers from many kinds of disease left votive offerings.

DATE From c. 550 B.C. The altar A.D. c. 130

weeks ago Commander Crean reports 100 cases, with only six failures and three relapses Dr Anwyl-Davies, who tested the effects of sulphanilamide on thirty-nine cases at the invitation of the Therapeutic Trials Committee of the Medical Research Council, writes that in the treatment of acute gonorrhoea the drug is ineffective and that it does not appear to act satisfactorily in combating the gonococcus

In the hope of clarifying this confused position and of giving other workers the benefit of our experience at St Mary's Hospital I am submitting this interim report of an intensive research which we are carrying out with sulphanilamide at the special (venereal) clinic The research was undertaken at the instigation of the director of the clinic, Dr Gerald McElligott, to whom I am deeply indebted for much inspiration, guidance, and encouragement At first small doses of sulphanilamide were tried on a group of cases of gonorrhoea, with inconclusive results Five weeks previously I started an intensive campaign on male patients (now totalling over 250), using larger doses and obtaining very different results We had hoped to postpone publication of this research until a large group of cases had been followed up for some months beyond their final tests of cure and until we were in a position to reach a decision based on a balanced analysis of final results But the obvious need to pool our experience of this potent drug, and especially to share our knowledge of its toxic effects and dangers, impels me to anticipate the issue of our final report with this preliminary article

First I must join issue with both Dr Anwyl-Davies and Surgeon Commander Crean I am quite certain that Dr Anwyl-Davies's pessimistic conclusions are wrong, and that his condemnation is based on inadequate evidence He used what we now consider to be only a moderately effective dosage in half his cases and less in the remainder A partial trial was therefore made in only twenty cases, and these are hardly sufficient to form an opinion on, particularly when dealing with a capricious drug But Surgeon Commander Crean's breezy optimism is almost equally off the mark One may be too fastidious, but it is difficult to accept cures based on final tests begun on the eleventh day and ended on the twelfth, or to agree that a vaccine dose of 50 million is provocative His conclusions, moreover, are not applicable to civilian patients, who cannot be kept in hospital and who do not compare with the average sailor in hardihood and therefore in tolerance The remarkable freedom of his cases from toxic symptoms (only two are reported to have had any) will never be approached by a civilian series Notwithstanding these points of criticism Commander Crean's article is a very valuable one, as it shows what can be done with proper organization I was particularly interested to notice that of his six complete failures four had acute prostatitis, as this agrees entirely with my own experience

Technique and Dosage

Our cases comprise every type of gonococcal infection in the male—recent acute, prolonged acute, chronic, and complicated—also a small group of non-gonococcal infections of the urethra, prostate, and bladder For purposes of therapeutic experimentation the patients are divided into four groups

1 A small group are treated with sulphanilamide only

2 A large group are given sulphanilamide and (for part of the time) a strongly alkaline mixture (30 grains each of potassium citrate and potassium bicarbonate, three times daily) As a control a few cases are taking an acid mixture

3 The largest group are treated with irrigations as well as sulphanilamide and alkalis

4 The smallest group are given a gonococcal or mixed vaccine in addition to the above

The sulphanilamide is given orally in 7½-gram (0·5 gramme) tablets (B.D.H.), taken after meals with a full glass of water Each patient receives a form setting out clear instructions on the taking of the tablets and on drinking large quantities of water, and emphasizing the importance of attending the clinic when told to do so (mostly every two to four days) It also instructs patients to avoid eggs in any form, and to take no aperients except such as we give them (with the object of cutting down the ingestion of sulphur) Apart from a few exceptions the patients continue at work Our actual dosage has varied within wide limits (from as little as 1 gramme to as much as 6 grammes a day), and I am not yet able to pronounce any hard and-fast rules on it There is a capricious element in the reaction of individual cases which makes standardization of dosage extremely difficult each case has to be treated as a separate problem Our experience, however, has taught us a number of important things which are guiding our present technique, and which I now tabulate

(*a*) To obtain optimum effects the sulphanilamide must be given in quantities which are potentially toxic

(*b*) The drug must be continued not only until all signs of the disease are gone but also for a further period if relapse is to be avoided The length of this second period varies with the lesion, but should not be less than one week or more than two

(*c*) The administration must be so spaced as to maintain a constant concentration of the drug in the blood and tissues. Sulphanilamide appears to be eliminated very rapidly and I believe that in as little as twelve hours the amount left in the body becomes subefficient For this reason we are now giving it in four doses (during the first stage of treatment)—three after the principal meals of the day, and the fourth last thing at night.

(*d*) A case of gonococcal infection either reacts to effective doses of sulphanilamide within a short period or it does not react at all It took us some time to recognize this fact, but I now believe it to be of supreme importance It is in resistant cases where one is tempted to persevere with the treatment for yet another week and to give larger and larger doses or to try another course after an interval, that the real danger of serious toxic effects lies For this reason it is now my practice when a patient fails to improve after a week or ten days on adequate dosage, to admit failure, and to give up the treatment at once

(*e*) The actual quantity of the drug (daily and total) must be kept within certain strict limits but its administration should vary with (i) the stage of the disease (ii) the presence or absence of complications (iii) the age, weight, and general condition of the patient (iv) the stage of the treatment, and (v) the patient's therapeutic and toxic reactions to it.

Guided by these principles, and subject to considerable individual variation, the sulphanilamide routine I am now employing is roughly as follows

1 *For Uncomplicated Acute Gonococcal Urethritis (Recent or Prolonged but with Positive Smears)*—Young men of good weight and condition take eight to ten tablets (4 to 5 grammes) daily, divided into four doses, until the discharge ceases (or becomes mucoid and free from gonococci) and the urine clears completely (except for an

BRITISH MEDICAL JOURNAL

LONDON SATURDAY NOVEMBER 6 1937

THE EARLY DIAGNOSIS OF INTRACRANIAL TUMOUR*

BY

F M R WALSHE, M D., D Sc., F R C P

Physician National Hospital Queen Square London Physician in-Charge Neurological Department University College Hospital

Perhaps the obvious way for me to deal with the subject would be to plunge at once into a description and discussion of those clinical features upon which we so largely depend for diagnosis and thus to make my remarks a simple summary of clinical information While this plan might be appropriate for an ordinary postgraduate lecture, I feel that the circumstances of our discussion call for some introductory remarks of a more general nature

With the steady increase of technical or instrumental aids to diagnosis it becomes more and more difficult for us to keep a firm grasp of those sound general principles which must always govern clinical diagnosis and to retain our faith in those methods which have been traditional in English medicine So much has been claimed for these newer technical methods that we are in danger of being led to suppose that they have rendered the careful physical examination of the patient superfluous In a word we are threatened with a triumph of technique over reason and the moment is apt for a brief restatement of principles which apply as nearly to the diagnosis of intracranial tumour as to that of any other of the ills that flesh is heir to

Principles in Diagnosis

Diagnosis has been defined as the identification of a disease by the investigation of its symptoms and history The method of informed and intelligent inquiry by which we elicit the story of an illness does not and cannot change in essence with advances in knowledge It is a task calling for and impossible of performance without a sound knowledge of general medicine Even the most intelligent patient does not relate complete and unaided the story of his illness He does not know always what is relevant and what is not The examiner must know what to ask for without putting the answer into the patient's mouth Indeed the taking of a history is an art calling not only for knowledge but for aptitude

The second stage in the identification of disease—namely the physical examination of the patient—demands no less in the way of qualifications It is one thing to elicit physical signs and a more difficult thing to assess their significance Here experience is essential—a fact which is daily borne home to the neurologist in his work Further it needs to be emphasized that the information gleaned by radiological studies and by blood and cerebrospinal fluid examinations can only be rightly assessed in connexion with the clinical findings They are additions to clinical examination and not substitutes for it This last is a point which certainly requires stressing It is painfully common now to have to make one's way through a barrage of pathological and other reports and through sheaves of *x* ray films before obtaining access to the patient and having at last done so we not rarely find that a large proportion of these expensive investigations have been unnecessary—they are merely recondite explorations of the irrelevant They have not been dictated by the exigencies of the situation but used as short cuts to diagnosis In short the attractive simplicity of these methods may easily tempt us to omit essential clinical investigation

Radiographic Methods

Now while no one will be disposed to dispute this general point of view many I fear, pay but lip service to it and no student of neurological literature can escape the conviction that in neurosurgical clinics especially, radiographic methods such as ventriculography encephalography and arteriography have come to take pride of place among diagnostic methods in the case of tumour and of such conditions as may be mistaken for tumour

The point of view that finds this technician's approach adequate receives passing reference in Cushing's final review of the 2000 cases of intracranial tumour which have passed through his hands In this review he remarks that "Dandy's ventriculography placed localization at a point where neurological studies seemed scarcely longer necessary Now it would not be right to regard this as expressing Cushing's own practice since the foundations of his renown as one of the pioneers in the diagnosis and treatment of intracranial tumour were laid long before this method was discovered yet it certainly indicates what is the eagerly accepted gospel of many younger surgeons whose all embracing faith in the radiograph is seen in their omission to equip themselves with that comprehensive knowledge of nervous diseases which can alone make neurological diagnosis efficient

In the circumstances it becomes of interest to see what in fact is the nature of the clinical material referred to the neurosurgical clinic when no neurological clearing house stands between it and the court of diagnostic first instance—namely the general practitioner Fortunately we do not have to speculate on the matter for Cushing's review already referred to gives the figures for what is perhaps the largest and most famous of such clinics In addition to the 2000 verified cases of tumours there came to his clinics no fewer than 1031 cases which proved not to be intracranial tumours—that is no less than one third of the total admissions This third included 157 cases of cerebral vascular disease fifty of encephalitis thirty eight of neurosyphilis thirty four of disseminated sclerosis 125 of epileptiform convulsions fifty four of headache eighty nine of arachnoiditis

* Portion of a discussion held by Section of Neurology and Psychological Medicine at the Annual Meeting of the British Medical Association in Bath 1937

Of the objective symptoms much the most frequent is a mild degree of cyanosis The cheeks, forehead, and neck are suffused with a rich pinkish colour, which is so common and characteristic that I have learned to regard it as almost an index of the patient who is taking his tablets This appearance is consistent with perfect health, and although I have examined the blood of many such patients not one has shown detectable quantities of methaemoglobin or sulphaemoglobin A few cases show a paler colour, approaching heliotrope, and these may have a positive spectrum (to the left of the D), but blue cyanosis has been definitely rare in our experience Perhaps the most interesting objective effect is a curious rash which I have now seen in ten patients It is a symmetrical urticaria-like eruption on the wrists, the flexor surfaces of the forearm, and (in two cases) on the legs and trunk The patients were all otherwise well, and the skin was normal again one or two days after discontinuing the sulphanilamide The actual eruption consists of pinkish, slightly raised papules, mostly small (but in two cases much larger), with an erythematous background which gives the rash a faintly morbilliform appearance I have also seen one case with a circular patch of simple erythema of the thigh

The most striking thing about this host of minor toxic symptoms is the rapidity with which most of them disappear, a few hours to a day or two after the sulphanilamide is stopped This rather supports the view that they are caused by absorption of the drug into the blood corpuscles, but it also appears to be an indication of the speed with which the drug is eliminated from the body Apart from a fading cyanosis in bad cases the only symptoms which tend to persist for a while are anorexia, nausea, and vomiting, but these may be gastric in origin Another very common phenomenon is the acquired tolerance which many susceptible patients develop if they persevere with safe amounts of the drug for a few days Again and again this acquired tolerance has come to our rescue when we were on the verge of stopping treatment owing to the lack of natural tolerance

An obvious consequence of these unpleasant if unimportant toxic effects is that some persuasion may be needed to make patients submit to the treatment Nothing can be done with the obstructive or non-co-operative type, while unintelligent people often drive one to the brink of distraction But in reasonable patients we ought to persevere with the drug along the lines I have indicated, unless the toxic effects become severe, a temporary halt is advisable in cases with severe gastric symptoms, intense headache, or skin rashes

The only toxic symptoms which might be attributable to the oral administration of the drug are anorexia, nausea, and vomiting In such cases it may be wise to try prontosil soluble by injections, although there will still be the chance of toxic vomiting

Early Results of Treatment

At this early stage of our work I am not prepared or able to give statistical figures, nor will I attempt to forecast the final results before the publication of the full report at the end of our research I can, however, make certain observations on the immediate experience of the 250 cases under my care at the present time It must first be pointed out that in a few of them the treatment has been abandoned owing to severe intolerance

1 Uncomplicated acute gonococcal urethritis clears up completely in a few days in a large majority of cases provided the sulphanilamide is taken in the quantities already referred to The discharge usually becomes scanty and mucoid after one or two days, and entirely ceases well before the end of the first week The urine becomes quite clear in two to six days, except for occasional mucous threads, which may persist for a few days longer A heavy phosphatic deposit is present in cases receiving the alkaline mixture, and large quantities of acetic acid are being used in examining the urines The mucoid fluid which can be expressed from the urethra in the first few days contains many epithelial cells, relatively few (sometimes very few) pus cells, and usually no organisms Occasionally a few scattered groups of gonococci can still be seen in the first smear (at the end of two days treatment), and even in the second (after two more days) but they are rarely found later than this By the end of the first week the urethra is quite dry and no smear can be obtained, prostatic beads and scrapings of the urethral walls show no organisms and no pus cells Furthermore, relapse does not occur if the sulphanilamide is continued for an adequate period

Such an experience, repeated scores of times and compared with numerous control cases on ordinary treatment which show crowds of gonococci in the discharge that persists day after day and usually week after week, soon convinces one that a potent destroyer of the gonococcus has at last been discovered A small minority of uncomplicated cases, however, do not clear up with sulphanilamide even if one modifies the technique or increases the dosage We now quickly recognize these resistant cases and write them off as failures, but not before we had wasted large quantities of an expensive and dangerous drug in a vain attempt to prove it an infallible remedy There is little difference in response to the treatment between recent acute cases and acute cases of some duration, although on the whole the early ones clear up a day or two sooner

2 In most of our cases treatment is still proceeding, but there is already a group of patients who have completed their full course of sulphanilamide and have been without treatment for one or two weeks Every one of these remains perfectly well, and quite a number have passed their tests of cure and are already on the follow up list

3 Cases of chronic gonococcal urethritis and prostatitis clear up at least as rapidly as the acute ones, and on smaller amounts of sulphanilamide The gleet ceases, the urine clears, and even the threads may disappear before the end of a week I cannot yet say what will happen to their complement-fixation test (usually very positive to begin with), but the proportion of clinical failures is very small

4 Non gonococcal cases react best of all A quite small quantity of the drug can effect a rapid cure, and I have not yet seen a failure

5 Some gonorrhoeal complications clear up with the technique used in uncomplicated cases and in roughly the same proportion But an unexpectedly large percentage of cases of acute prostato-vesiculitis, with or without an associated epididymitis, have proved extremely resistant to the drug Some of these have yielded to repeated short courses of intensive treatment, but the majority have had to be written off as failures A probable explanation is that we are dealing with a closed focus and that a staphylococcal secondary infection is added

6 I cannot yet say what part, if any, other methods of treatment used in conjunction with sulphanilamide, have played in our successful results but there can be no question that they have been completely dwarfed by it

brain These may precede the various signs and symptoms of raised intracranial tension In this case it is the time factor as much as the character of the signs that betrays the probable nature of the lesion But even such a mode of development of organic signs is not free from danger for the unwary Thus take the case of an elderly man who complains of a slowly developing weakness of the limbs of one side His tale may easily suggest the insidious onset of a hemiplegia and the presence of a tumour in the depths of one cerebral hemisphere Yet the commonest explanation of such a complaint in such a patient is the onset of paralysis agitans without tremor or with but infrequent tremor Of course an adequate examination of the nervous system would reveal the true nature of the situation yet I have known two patients submitted to exploratory craniotomy from a failure to recognize early paralysis agitans

Another symptom complex which has a localizing value is one in which somatic signs may long be wanting one in which a progressive temperamental change is the initial symptom Such a change may occur with tumours in other situations than in the frontal lobe but I believe that the opening of the clinical course by an increasing apathy and loss of initiative a tendency to unaccustomed reticence and to defective attention, and a poverty of ideas is pathognomonic of a frontal lobe tumour When added to this we find the unnoticed or perhaps it would be more accurate to say the unregarded incontinence of urine wherever the patient may happen to be when nature calls the picture is a characteristic one that cannot be mistaken It may exist and grow for months before any complaint of headache is made and in such a case papilloedema may be but a terminal symptom I have known such patients to be regarded and treated as primary depressives yet actually they are readily to be differentiated from this psychosis

4 SECONDARY CARCINOMA OF BRAIN

One other clinical picture calls for mention here—that of secondary carcinoma of the brain It cannot always be recognized but there are certain indications that it may provide It is perhaps most common in association with primary carcinoma of the lung and its incidence in this and other visceral carcinomas is probably greater than has been realized in the past It may become clinically evident before the primary growth—especially if this be in the lung—has been suspected and such peculiarities as it may present probably depend upon the fact that the secondary growths are multiple within the brain, and that the leptomeninges may be extensively infiltrated—sometimes in the absence of macroscopic nodules within the brain

The presence of very numerous secondary growths in the brain substance is probably responsible for the difficulty of making any localizing diagnosis and I believe too for the frequency with which mental disturbances—muttering delirium, gross defect of memory confusion and so on—are present in these cases The meningeal involvement leads to signs suggestive of meningitis neck and back rigidity Kernig's sign stupor and so on Very rarely carcinoma cells have been found in the cerebrospinal fluid

Years ago when meningeal infiltration by growth was unrecognized, Oppenheim discussed the late appearance of mental and cerebral symptoms in cases of visceral carcinoma and attributed these to a toxic action of the primary growth upon the nervous system When such a confused picture accompanied by signs of raised intracranial tension, is associated with progressive cachexia and loss of weight secondary carcinoma should always be suspected and the primary growth sought for before any question of surgical intervention is raised In fact I believe that progressive loss of weight in any case of suspected intracranial tumour should be carefully investigated as a possible case of primary visceral carcinoma

Conclusion

In conclusion it will be apparent from what I have said that the *early* diagnosis of tumour is in some instances though not the majority difficult and may even be impossible This is perhaps most often the case in elderly persons with some cerebral atheroma The presence of this not only blurs the picture of tumour but adds difficulties of differential diagnosis We have seen too that rarely a tumour may be clinically latent These facts will warn us not to expect invariable success in early diagnosis even though we employ every available technical addition to clinical investigation I know that some observers are more sanguine than this but they have not convinced me

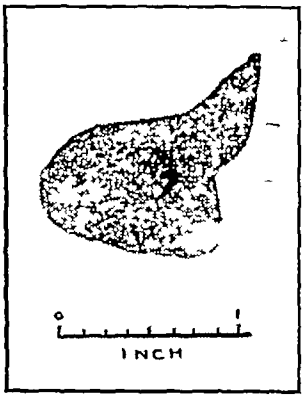
Of the various technical methods which are from time to time necessary to amplify such information as may be obtained by purely clinical means it is not my province to speak Perhaps the one from which the clinician might reasonably hope most is arteriography after thorotrast injection according to the newer technique adopted in Germany but not yet in use here Unfortunately the suspicion that thorotrast is a carcinogenic substance must make us cautious of its use

---

THE EARLY DIAGNOSIS OF INTRACRANIAL TUMOUR*

BY

NORMAN M DOTT, M B, F R C S Ed



Lecturer in Neurological Surgery Edinburgh University
Neurological Surgeon Royal Infirmary and Jordanburn Nerve Hospital Edinburgh

In discussing the early diagnosis of intracranial tumours it may be well that we should consider tumour in its wider and etymological meaning of a swelling rather than restrict ourselves to the narrower significance of a neoplasm Thus we shall include in our survey lesions whose gross pathology or clinical behaviour simulates tumour of the brain We shall include in addition to neoplasm such conditions as chronic haemorrhagic collections certain types of hydrocephalus chronic abscess tuberculoma, aneurysm etc

We are to consider their *diagnosis* To be of clinical value the diagnosis must answer three questions Is there a tumour? Where is it located? What is its probable nature? It must answer these questions with a view to practical treatment It is important to realize that for the adequate direction of surgical or radiological treatment it is no longer sufficient to make a gross regional diagnosis such as right frontal tumour To treat it adequately we must know much more before we open the head or direct radiation to it We must, if possible (and with adequate investigation it often is possible) define its nature and histology We must know its exact outlines and boundaries its relation to important blood vessels, ventricular cavities, etc

* Read in opening a discussion in the Section of Neurology and Psychological Medicine at the Annual Meeting of the British Medical Association, Belfast, 1937

Shortly after admission the child developed attacks of severe dyspnoea with cyanosis and digital examination of the throat revealed a firm fleshy, slightly movable mass immediately behind the soft palate The tumour was easily shelled out by Mr W F Wilson consulting otolaryngologist and it was noted to be roughly ovoid in shape about 1¼ inches in its longest diameter, presenting at one point a short fleshy tongue (see figure) with which it appeared to have been attached high up to the nasopharynx The breathing was relieved immediately and the infant fell into a quiet sleep Very little epistaxis occurred Four days later she was discharged with normal respirations and taking her feeds well

Some weeks later the infant was stated to be gaining weight satisfactorily There was no further nasal discharge, nor had she any difficulty with feeding or breathing Beyond the pathological report of the tumour subsequent reports Wassermann (negative) and throat swab (negative to the Klebs Loeffler bacillus), are irrelevant.

The report by Dr J G Thomson, Pathological Department, Royal Victoria Infirmary, Newcastle-upon-Tyne, stated 'This flattened pedunculated tumour is covered by keratinizing squamous epithelium, ulcerated in places It has a stroma composed partly of adipose and partly of connective tissue, and scattered in this are very numerous hair follicles, with some sebaceous and sweat glands In the centre of the tumour is a nodule of cartilage The tumour is evidently a teratomatous one, and is quite benign"

I am indebted to Dr J A Charles medical officer of health Newcastle-upon Tyne for permission to publish this report.

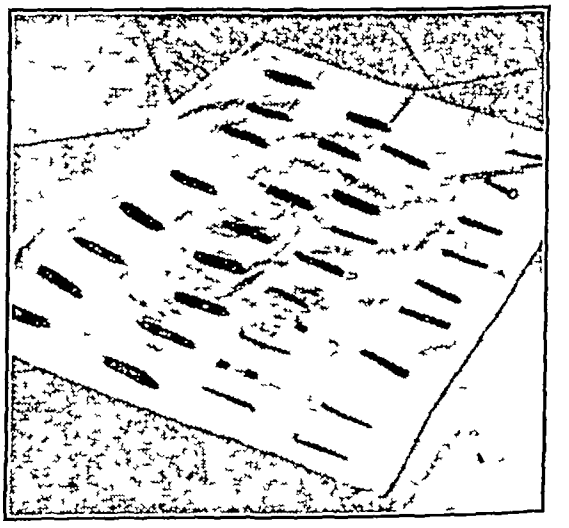
Multiple Foreign Bodies in the Stomach

This type of case occurs either in lunatics or professional swallowers, in this instance it was in an Indian conjurer



The man, a Hindu, an ex-sepoy, specialized in eating razor blades and penknives, and in biting off the heads of cobras After his act he used to drink a pint of water before sleeping, in the morning he swallowed about six yards of two-inch tape, keeping one end in his mouth, and performed some rhythmic exercises with his stomach and abdominal muscles—as he stated, a kind of yoga He would then withdraw the tape, swallow another pint of water, have a bowel action, and recover the properties of the day before

Three months ago he was unable to recover what he had swallowed at one night s performance Thinking they would appear he went on with his act for two more days but the articles did not appear, and so he accumulated quite a collection in his stomach At that time he was touring the Frontier, and from there was sent to me complaining of loss of appetite, the vomiting of dark brown fluid, and having black stools On examination a large mass could be felt to the left and below the umbilicus, this was quite mobile and could be pushed anywhere Radiographs were taken and the collection shown in the photograph was revealed

He was operated on under spinal anaesthesia, and nineteen penknives and pieces of about six others which had been acted on by the gastric juice and markedly corroded,

plus two keys, were removed from the stomach This was done through a vertical incision in line with the vessels on the stomach wall, the incision being afterwards reinforced with omentum The knives were quite

mobile, and their removal was facilitated by tilting the head of the patient up, when they literally poured into the incision He made an uninterrupted recovery, and within thirteen days gave a performance for the staff of the hospital Fig 1 s a reproduction of an *x* ray plate of the stomach, and Fig 2 that of a photograph of the articles removed

R DE SOLDENHOFF Capt I M S,
St. George s Hospital Bombay Resident Medical Officer

tumour cases Again however the data when positive are often of great value and should be sought for as a routine

The pressure of the fluid in the theca should be measured with a manometer The manner of the flow of the fluid from the needle is not a reliable index of the pressure within the theca The patient should be placed in the lateral recumbent posture and must be quiet and fully relaxed when the pressure reading is taken The normal cerebrospinal fluid pressure varies within wide limits A pressure of over 200 mm of fluid is to be regarded as suggestive of pathologically increased intracranial pressure

The colour and translucency of the fluid are carefully noted Yellow fluid suggests a tumour in or near one of the ventricular cavities of the brain or extravasated blood in contact with the fluid Opacity of course suggests the presence of cellular elements

The total protein content of the fluid should be estimated and the cellular elements should be identified and counted An increase of protein or cells or both is significant of an active disease process in the central nervous system Generally an increase of protein alone and especially of its globulin fraction is significant of neoplasm while a notable increase of cells suggests an inflammatory disease Occasionally tumour cells are recognizable in the fluid and may furnish an accurate histologic diagnosis The presence of pathologically significant blood in the cerebrospinal fluid is distinguished from accidental contamination during the puncture by the yellow colour of the supernatant fluid on centrifuging and by the crenated appearance of the red corpuscles Rarely bleeding into the subarachnoid space may occur from a tumour Much more commonly it is due to leakage of blood from an intracranial aneurysm Often it will be desirable to have the chloride and sugar content of the fluid examined and the gold precipitation curve and the Wassermann reaction estimated when a differential diagnosis from certain forms of meningitis encephalitis or neurosyphilis is being considered

Having clinically examined *x* rayed and lumbar punctured his patient the diagnostician may well pause and take stock of the situation If he now feels that he has made a reasonably certain and accurate diagnosis he will proceed to construct his plan of campaign for the treatment of the disease If he cannot answer the three diagnostic questions—Is there a tumour? Where exactly is it located? What is its probable nature?—he must adopt further diagnostic procedures If the symptoms are of recent onset and mild character he may well decide on a period for further observation and clinical re examination If, however symptoms are severe and especially if papilloedema is present and vision is threatened thereby he must proceed forthwith to make his diagnosis by using further special investigations He may also incline to do so if the symptoms though mild, are strongly suggestive of tumour in order that he may gain the advantage of applying treatment as early as possible

Ventriculography

Ventriculography will usually be the next step Actually I have employed it for one reason or another in about 40 per cent of brain tumour cases In 60 per cent the diagnosis has seemed accurate enough for operative purposes without it

Here again I must stress the degree of accuracy necessary for the planning of modern brain surgery It is quite necessary that before beginning the operation we should visualize the detailed relations and exact extent of the tumour In twelve years experience of this work as a specialty I find myself employing ventriculography and arterial radiography in an increasing proportion of cases This is in spite of the fact that my clinical diagnostic ability has naturally improved with experience It is because operations have become more purposive and more radical in character and require more exact diagnostic guidance I feel certain that along with ever improving clinical diagnosis we shall in the future employ ventriculography arterial radiography and similar diagnostic additions and refinements in an increasing proportion of our tumour cases

Ventriculography implies the rendering of the ventricular cavities visible on the x ray film by filling them with a contrast medium Commonly the ventricular fluid is replaced by air or oxygen The procedure is to be regarded as a minor surgical operation It is done with local anæsthesia Small burr holes are made in the skull and the ventricles are tapped with suitable cannulæ By these means we are able to visualize the cerebral ventricles and to observe alterations in their size position and form Such alterations are necessarily present in practically all cases of brain tumour

Ventriculography may occasionally be employed to discover whether a brain tumour is present or not Thus it may be used in a case of focal epilepsy not exhibiting signs of intracranial pressure in order to assess whether the local cerebral symptoms are due to a space occupying lesion or not Most commonly it is used in cases in which increased intracranial pressure is already established but in which clinical and radiological examinations have failed to disclose the site and nature of the responsible disease It may often be employed advantageously in supplement to the preceding examinations for the more accurate delimitation of the boundaries and relationships of a tumour whose general situation is already known It may be necessary to resort to ventriculography when the patient is unable to co operate satisfactorily in clinical examination by reason of his cerebral disease or any other cause These are its principal indications Its contraindications are those of any operative procedure which is potentially dangerous Safe enough in cases without heightened intracranial pressure its dangers increase with the pressure The dangers are due to sudden cerebral displacements which ventricular tapping may permit and especially the impaction of the brain stem in the tentorial aperture when ventricular distension is suddenly released above a cerebellar tumour These dangers can be practically eliminated if the necessary operation is always carried out immediately following the ventriculography In cases with increased intracranial pressure, then ventriculography when necessary is to be regarded as the last step in diagnosis and is to be followed within an hour or two at the most by the operation for relief of the condition identified It should be appreciated that the dangers attendant on opening the skull in the wrong place in the presence of increased intracranial tension are very much greater than those of properly conducted ventriculography

Interpretation of Ventriculography

The adequate interpretation of ventriculography often requires much experience of the method The appearance of the dura exposed at the burr holes may at once suggest a diagnosis of subdural haematoma The tension of the dura is important to note The characters of the small

longus muscle needs correcting The most disappointing part of the work is the section on the treatment of injuries and diseases of the head This is far behind current neurosurgical practice Pictures of Chipaults' lines, metal rods for scalp haemostasis, Friedman s haemostatic safety-pins, etc , are only of historical interest to-day, while few surgeons now use scalp tourniquets Modern methods of controlling haemorrhage from the scalp are not mentioned Much the same criticism may be levelled at the section on the surgery of the spinal cord Chordotomy is not mentioned, and the resection of posterior roots from the third cervical to the third dorsal inclusive advocated for pain in the arm will surely produce an ataxic useless limb

These great systems are probably less popular and less common to day than they were some twenty or thirty years ago This one is a monument to the industry of its authors , but, while much in it is good and likely to be helpful to the practising surgeon seeking help in his library, much, we think, might well have been omitted and been better dealt with by reference to modern monographs on special branches of surgery

THE BART'S REPORTS

St Bartholomew s Hospital Reports Vol lxx (Pp 381 illustrated 21s. to subscribers, 15s) London John Murray 1937

The *St Bartholomew s Hospital Reports* edited by a committee of nine representing the main divisions of medical practice and science, contain fifteen original articles covering a wide field, sympathetic *in memoriam* notices of Professor E H Kettle and Mr T H Just, and records of the proceedings of the Abernethian Society and the Paget Club The treasurer of these *Reports* Mr W Girling Ball, whose initials are attached to the obituary of Mr Just, gives his personal experiences of the surgery of the gall-bladder, both as a patient (his gall-bladder, closely packed with small cholesterol calculi, forming the frontispiece to the article) and from his care and analysis of a hundred cases of gall-bladder disease This record of personal observation contains many points of interest, among which attention may be directed to the conclusion that gall-bladder disease occurs at an earlier age than is usually stated In his own case an attack of colic while he happened to be on the *x* ray table showed that the colon was spasmodically contracted

In an analysis of the students entering the school—on an average 106 annually—Mr Girling Ball shows that no fewer than 78 per cent enter for a university degree

In his account of the pre operative and post-operative treatment of congenital hypertrophic pyloric stenosis Dr Charles Harris discusses the comparative infrequency of cases at this large general hospital where in eight and a half years thirty-seven cases only were admitted, whereas at the Infants Hospital there were forty-six admissions in 1936 All the St Bartholomew s patients underwent Rammstedt s operation, described here by Mr G Keynes, and all but one survived The report of the cancer department, of which Mr Malcolm Donaldson is the director and Dr D G ff. Edward the registrar, contains much interesting information The significance of lympho-epithelioma tous tumours of the nasopharynx and jaws—tumours of epithelial syncytia separated by lymphocytes—their malignancy and radiosensitivity, are described by Mr F C W Capps

The activities of the laboratory workers are shown by Dr Wormall s paper on the chemical aspects of immunity , by notes on the value of biochemistry in the diagnosis of bone disease by Professor Paterson Ross, Mr Discombe, and Dr Robb-Smith , and by Dr Brewer s contribution on the titre of iso-haemagglutinins in human sera Two interesting papers—Dr Brodribb s essay on artificial fever produced by physical agents and Dr Clive Nicholson's analysis of thyrotoxic arrhythmias—are based on theses for the M.D degree The treatment of non expanding lung after spontaneous pneumothorax is explained by Dr Chandler, and Dr Maxwell writes on massive collapse in bronchitis and asthma Attention must also be drawn to the articles on suppurative arthritis of the hip by Mr J P Hosford and on treatment by manipulation as carried out in the years 1932–6 in the orthopaedic department by Mr H J Burrows and Mr W D Coltart

THE ORIGIN OF PUNISHMENT

Punishment Its Origin Purpose and Psychology By Hans von Hentig (Pp 239 12s 6d net) London William Hodge and Co 1937

Until quite recently most people, even those whose duty it was to administer punishment, inflicted fines, imprison ment, and death without questioning their efficacy or rightness Their theory, which is even now hardly begin ning to be shaken, is that persons who break the law, whether by homicide or by failing to take out one of a series of official licences, are nuisances to society, and must be treated in a manner sufficiently unpleasant to make it improbable that they will offend again The disconcerting discovery that lawbreakers do offend again in spite of punishment has caused an increasing number of intelligent and responsible persons to inquire into the nature of punish ment what it does to the offender and to society, why it should be inflicted, and whether fear is always the best instrument of correction

Professor von Hentig, who recently held the chair of penal law and criminology at Bonn University, regards punishment as the establishment of artificial danger, an impairment of life which society consciously uses to train humanity to avoid certain possible causes of action poten tially injurious to itself It is, he says, an imitation of precedents provided by real life If punishment always reached this ideal it would probably be nothing but bene ficial The history of real punishment, however, nearly always shows a lack of comprehension which deprives it of its potential value This book makes a useful contribu tion to this necessary understanding, especially the chapter on the mental classification of punishment The author s suggestions for the future lay stress on the examination of the offender and the matching of the punishment to his mentality rather than to the nature of the offence Im prisonment providing purely institutional life is, he points out, of little use the offender needs training in real life, with its constant demand for judgement and decision If the book has a fault it is a certain inconsequence of arrangement combined with a somewhat catalogue like rigidity

HUMORAL TRANSMISSION OF NERVE ACTION

Autonomic Neuro Effector Systems By Walter B Cannon, George Higginson and Arturo Rosenblueth (Pp 230 17s) New York The Macmillan Co 1937

The possibility that excitation may be transmitted by the mediation of chemical substances of high potency and unstable structure has been mooted for over thirty years, but remained a mere speculation until about 1921 In that year Loewi made his classical experiment on the frog s heart, which showed that on stimulating the vagus there was set free a chemical substance which produced

In cases of suspected aneurysm of the cerebral arteries we have found the arterial radiograph of great value In this connexion the method may be employed in order to prove or disprove the presence of an aneurysm as the cause of a suggestive clinical syndrome Again it is used to localize the precise site of an aneurysm already diagnosed as such on clinical grounds Exact localization may be quite impossible by other means when the aneurysm has declared itself by haemorrhage only, yet it may be of vital importance in guiding the appropriate treatment

Cerebral Biopsy Puncture

We may have knowledge of the presence and site of a tumour and be uncertain as to its nature Often we shall be satisfied to expose the tumour with these data and to learn its exact pathology after exposure There are cases however in which a diagnosis of the nature of the tumour is specially important before operation is decided on Such are the cases of rapidly developing tumours of the cerebral hemispheres and particularly those deeply situated in the brain Many of these are malignant glioblastomas and in them the results of operation are so poor that it is wiser not to operate if one can be certain that the tumour is of this type Our clinical suspicion is aroused by the rapid development of symptoms by the emaciated or toxic appearance of the patient and by drowsiness and elevations of temperature suggesting basal cerebral oedema Nevertheless all these signs can be simulated by the development and rapid filling of a cyst in relation to a benign tumour and we therefore desire to verify the pathological diagnosis before deciding against operation

To accomplish this a small burr hole is made in the overlying skull under local anaesthesia and an exploring cannula is gently passed to the site of the tumour through the brain The texture of the tumour is noted as the cannula encounters it and enters its substance Its vascularity may be estimated by the degree of oozing of blood from the track after withdrawal of the cannula Usually if the stylet is withdrawn from the cannula while it is in the tumour, and the cannula is gently rotated and then withdrawn a fragment of tumour will be found adherent in its eye If this fails to secure a fragment the same manipulation accompanied by gentle suction through the cannula will usually succeed The fragment is spread on a slide and examined fresh or appropriately fixed stained and mounted The microscope then reveals the histologic type of the tumour

Conclusion

I would chiefly emphasize that these various special accessory methods are available to us Between well conducted clinical diagnosis and the application of one or more of these special methods if and as required, a correct diagnosis of the existence of a tumour and its site should be and is, accurate in about 99 per cent The 1 per cent lapse is accounted for by occasional difficulties such as may arise in connexion with multiple secondary tumours The histologic nature of the tumour can be forecast with reasonable certainty in about 70 per cent of cases at present This figure is constantly being improved with increasing experience of clinical and special methods of investigation If then we suspect a brain tumour in an early stage there is little excuse for us to fail to pursue the diagnosis to a high degree of certainty and accuracy The diagnostic procedure is carried out with the ultimate purpose of treatment and cure All the data necessary to this end are to be assembled from clinical neurology ventriculography arterial radiography, etc as required for adequate treatment Obviously, after the initial stage of suspecting a brain tumour its diagnosis can be pursued to a conclusion only by a person specially trained and experienced in the work

I do not believe that adequate diagnosis of brain tumours with a view to directing modern treatment can reach its highest development as the composite effort of several individuals however expert they may be in their particular departments The diagnostician who assumes responsibility for the patient's welfare must know the business from A to Z He must be a competent neurologist he must have practical experience of the values and dangers of all available special methods of diagnosis Further he must have intimate knowledge of modern operative and radiological treatment of brain tumours How else can he judge what diagnostic data are going to help the patient most when he reaches the operating table or x ray couch? It has often and rightly been stressed that the sick patient is still to be considered in all his aspects as a human unit Similarly I think the diagnosis and management of his complaint—especially when it is a brain tumour—must be studied and guided in continuity by one responsible person I would plead against a tendency which still persists to relegate the diagnosis to a physician the ventriculography etc to the combined effort of surgeon and radiologist the treatment to surgeon or radiologist The pure physician is seriously handicapped by lack of knowledge as to what exactly is required of him his very purity precludes an intimate knowledge of surgical requirements in defining tumour outlines relations etc The special instrumental diagnostician and the surgical specialist are obviously positive menaces unless from neurological study they fully appreciate the patient's predicament and all that can be known of his disease

I feel strongly that in the arrangement of specialism in relation to intracranial tumours the specialty should consist in their investigation *and* treatment The division into diagnostic specialist of brain tumours and other unrelated conditions and into surgical specialist for the brain and other unrelated organs is much less advantageous to the individual patient and to scientific advancement This unorthodox combination of medicine and surgery in the person of a neurological surgeon is a natural and inevitable development due to force of circumstances Sir Victor Horsley was a pioneer in this direction Such great men as Harvey Cushing and Otfried Foerster have found for themselves and proved to others, that such a manner of working was necessary to the results they have achieved in curing the sick and in advancing medical science Let me hasten to add that no neurological surgeon can have that extensive knowledge of non surgical nervous disease proper to the pure neurologist Nor can he acquire that familiarity with perimetry outside the field of brain tumours which the ophthalmologist possesses nor plumb with the radiologist the depths of electrophysics His knowledge must however extend sufficiently into these bordering provinces that he may be quick to call the appropriate colleague to his assistance when occasion demands

The fourth report of the Joint Advisory Committee on River Pollution (H M Stationery Office 3d) is addressed to the Minister of Health and the Minister of Agriculture and Fisheries and is devoted to the position with regard to river pollution which has developed in consequence of the Land Drainage Act, 1930

LUNACY AND MENTAL DEFICIENCY

REPORT OF THE BOARD OF CONTROL*

The statistics of mental disorder in England and Wales show a rather baffling steadiness from year to year The pendulum of admissions to institutions and discharges therefrom swings with hardly noticeable variations The financial difficulties and economic perturbations of recent years do not appear to have brought about any increase of incidence, and the effect of continued unemployment has not reacted on the mental health of the nation in the way that many had anticipated It is true that the number of admissions to public mental hospitals tends to rise somewhat During 1936 it rose to 25,660 cases, as compared with an average for the last quinquennium of 22,654 But if allowance is made for the age distribution of the population there is no indication of real increase Mental disorder begins generally in adult life, and therefore the admission rate to mental institutions has to be related not to the current birth rate but to the birth rate of some decades ago, when the population was growing far more rapidly than now Even if the population became stationary the fact would not be reflected in the admission rate until after a quarter of a century at least All that the admission figures mean is that the total population old enough to be subject to mental disorder has increased, and making allowance for such age distribution there is no real increase in incidence

At the same time, if the position is no worse, it is hardly perceptibly better Progress in the direction of prevention is slow New methods of treatment, apparently do not affect noticeably the discharge rate, though it is possible that there is an improvement which is being masked For example, housing conditions and the weakening of home life have led to the admission to institutions of many elderly and old people who, a generation ago, being harmless lunatics—as they would have been called then—would have been cared for in their own homes and the number of these senile cases with no hope of discharge affects adversely the general discharge rate The same domestic conditions lessen the number of discharges of non-senile patients, who might otherwise be cared for at home Thus a medical improvement may be concealed by social change

Treatment of Mental Disorder

During 1936 there were 5,563 departures and discharges of voluntary patients as compared with an average of 2,525 for the previous quinquennium, the corresponding figures for certified patients show a slighter fall—8,999 from a quinquennial average of 9,731 The departure of this large number of voluntary patients more or less balances the increase just referred to of direct admissions of all patients, and this is satisfactory inasmuch as it suggests that real progress is being made in the treatment of mental disorders in the early stages

But Sir Laurence Brock and his colleagues on the Board are by no means satisfied that enough is being done to assist recovery They point out that in too many public mental hospitals the medical staff is little more than adequate for maintaining the physical condition of the patients In the less progressive hospitals suggestions for even the most modest addition to the medical staff are too often postponed or ignored Yet in psychiatry of all things 'mass production' methods are bound to fail. To win the patient's confidence, to discover the mental background, and to unravel the history of a case take much time

many visiting committees while ready to provide new buildings and equipment, are sceptical of the value of treatment which appears to consist merely of talk, they will spend freely to provide buildings and equipment, but they grudge expenditure on staff needed for psychotherapy Perhaps it will always be difficult to persuade Englishmen to believe in a form of medicine which uses no lancet and prescribes no pill"

Steps have been taken to reconstitute a committee to advise the Board upon the principles to be observed in approving schemes for subsidizing research The setting up of this committee was decided upon some years ago, but the financial crisis of 1931 made it inopportune to convene it, and the project had to be postponed It is hoped that the committee, of which Lord Radnor is chairman, will be able to devise a practicable scheme for enlisting the help of the universities and medical schools in the investigation of those larger problems which are beyond the resources, necessarily limited, of individual hospitals

One of the commissioners of the Board has recently visited Vienna and Münsingen in Switzerland to investigate the new method of treating schizophrenia by insulin shock It is considered premature to express any opinion as to the ultimate value of this method but the results so far obtained show that it warrants a careful trial It is vitally important to the success of the test that great care should be taken in the choice of suitable centres for the experiment and that those who propose to employ the treatment should have the advantage of the experience already gained either by studying its operation elsewhere or securing help from abroad

Out-patient Provision

The Board reports that there are now very few places where provision is not made for out-patient treatment within the area served by the mental hospital The steady growth of provision for out-patient treatment is regarded as encouraging, but if the treatment is to be really effective sessions should be held at least once a week This obtains at most of the 155 such centres in the country, but in a few areas the sessions are held fortnightly monthly, or at longer intervals One point to which the Board draws attention is the lack of co operation, in some cases on the part of teaching hospitals Outside the metropolis there are fourteen voluntary general hospitals forming part of the medical schools of ten universities, each is dependent for its undergraduate teaching in psychological medicine upon the clinical field and the staff of the neighbouring mental hospital At almost all these hospitals out-patient treatment of mental illness is carried out, but at one-half of them none of the medical staff of the neighbouring mental hospital takes any share in such out-patient work

The failure to make fuller use of the opportunities for co operation is held to be due to the fact that three important lessons have not yet been learned—namely, that there are many cases of nervous and mental illness that are more susceptible to out patient treatment than to treatment involving admission to hospital, that in patient treatment in a mental hospital is much more effective and easily carried out if the patient comes in voluntarily, and that the best chance of persuading him to come in voluntarily is that he should, in the first instance, receive treatment in the out-patient department of a voluntary general hospital, especially if he sees in such department the physician from the mental hospital to which he may have to be persuaded to seek admission

Posts in Mental Deficiency Institutions

Mention is made in the report of the difficulty experienced in finding doctors to fill the top posts in the new colonies and other mental deficiency institutions which are being established Some of these appointments have gone to medical officers whose previous service had been spent mainly, or even entirely in mental hospitals The Board of Control is far from holding that the two branches of psychiatry ought to be kept rigidly separate but the organization and control of a mental deficiency colony call for special qualities and an attitude of mind not necessarily possessed by every psychiatrist The handling of defectives is, in the main, a problem of training and

* Twenty-third Annual Report of the Board of Control for the Year 1936 Part I London H.M Stationery Office 1936 (Pp 89 1s 6d. net.)

no longer holds good For example progesterone which when injected alone into ovariectomized animals has the least effect on the sexual organs becomes one of the most active and important of the female hormones when oestrone or oestradiol is administered simultaneously with it

Suggested New Classification

The bisexual properties of the sexual hormones make difficult the understanding of their mode of action and render the old classification into male and female hormones inadequate We suggest for critical consideration a new scheme of classification of the sexual hormones based on the results of our experiments dividing them into three groups, of which a detailed definition has been given elsewhere (Korenchevsky, Dennison and Hall 1937) This classification according to bisexuality has as its basis the actual activity of the hormones on male and female sexual organs, irrespective of the mechanism of such activity For example, in the female organism this mechanism could be in the form of activity of the male hormones (1) without chemical change, or (2) after their conversion into other male hormones, or (3) after their conversion into female hormones Disregarding the mechanism involved we suggest a grouping as follows

I. PURELY MALE OR FEMALE HORMONES

So far as is shown by the results of our experiments of the hormones investigated progesterone is the only member of this group This hormone of the corpus luteum having no definite effect on the male rat, may be defined as a pure female hormone

II. PARTIALLY BISEXUAL HORMONES

1 Hormones with Chiefly Male Properties

Although the hormones of this group do bring about some return towards the normal of the atrophied sexual organs of ovariectomized females with the same doses the degree of recovery of these organs is less than that of the atrophied sexual organs of castrated male rats To this group belong androsterone testosterone propionate, androstanediol and probably Δ^4 androstenedione

2 Hormones with Chiefly Female Properties

Oestrone and oestradiol belong to this group These two hormones have a marked effect on the female sexual organs but do not stimulate to any considerable degree the normal development of the male sexual organs, in particular the prostate penis, and preputial glands They have a definite effect in males however on the seminal vesicles and on the coagulating glands (Korenchevsky and Dennison, 1935)

III TRUE BISEXUAL HORMONES

To this group seem to belong transdehydroandrosterone testosterone and Δ^4 androstenediol since in prolonged experiments they bring about a return to or towards the normal of all the atrophied sexual organs to approximately the same degree in males and females

It must be pointed out, however that further investigation of the bisexual properties of these hormones might result in one or more of them being moved from one group into another

Co-operative Activity

The reason for investigating this aspect of the problem becomes clear when one remembers that (1) several sexual hormones have been isolated from both the male and female organisms and (2) both male and female activities have been found in organisms of either sex It is reasonable to suppose that the male activity may be explained by the presence of some of the sexual hormones found in the male (probably partly by dehydroandrosterone, Callow, 1936) We therefore investigated all the 'chiefly male' hormones the "true bisexual hormones and progesterone the 'pure female hormone' from the point of view of their co-operative activity with oestrone and oestradiol on the female sexual organs of ovariectomized rats We summarized the results obtained by dividing the hormones (in the doses used) into five groups

GROUPS I II AND III

Group I consisted of bisexual hormones appearing to have no co operative activity in females with oestrone or oestradiol To this group belong transdehydroandrosterone and Δ^5 androstenediol This group might even be termed antagonistic since one of the female properties of these two hormones, mucification of the vaginal epithelium is suppressed by oestrone When either of these two hormones is injected simultaneously with oestrone the changes typically due to the action of oestrone are obtained, with or without cornification of the vaginal epithelium

Group II of bisexual hormones having co operative activity with oestrone and oestradiol resulting in simple restoration to or towards the normal condition of the uterus and vagina without progestational changes, includes only androsterone

Group III comprised bisexual hormones having co operative activity with oestrone and oestradiol resulting in recovery to or towards the normal condition of the uterus and vagina with, in addition the development of changes more or less reminiscent of those seen in pregnancy To this group belong Δ^4 androstenedione androstanediol testosterone, and testosterone propionate In addition to an increase in size and weight one of the chief progestational changes in the vagina of the rat is mucification of the epithelium while in the uterus the mucosa develops lace like foldings and the myometrium greatly hypertrophies All the hormones in this group even when injected alone, bring about mucification of the vaginal epithelium to a greater or less degree but never to the extent seen in pregnancy Only when oestrone is injected simultaneously does one obtain the complete mucification of the epithelial layer similar to that found in pregnancy The structure of the vagina in other respects, (larger size and better development of the various layers) is also reminiscent of the 'pregnant vagina In contrast to this ease of production of the pregnant vagina the progestational changes in the uterus (though even here poorly developed) were definitely seen only when either testosterone propionate alone or more especially when testosterone propionate and oestrone together were injected

GROUP IV

Group IV included only progesterone as a purely female hormone showing a co-operative activity with oestrone or oestradiol resulting in the production of changes closely approaching those of pregnancy With the combined injections of progesterone with oestrone or oestradiol histologically the nearest approach to the picture presented by the uterus and vagina in normal pregnancy was obtained by the use of 1 γ of oestrone injected three times a week along with daily injections of 1,500 γ of progesterone Increasing the dose of oestrone even to only 6 γ or decreasing the dose of progesterone caused a decrease in or with some doses even a disappearance of the progestational changes and especially those observed in the uterus Even increasing both doses simultaneously to a combination of 30 γ of oestradiol three times a week with 3 000 γ of progesterone daily gave uterine progestational changes which were less than those obtained with the first combination of 1 γ of oestrone three times a

SATURDAY NOVEMBER 6 1937

INTRACRANIAL TUMOUR

When a diagnosis of intracranial tumour was tantamount to a death sentence the early recognition of this dread disease was of no practical importance, and no harm was done by waiting until the classical triad—headache, vomiting, and papilloedema—had revealed its later effects even to the least experienced The success which has attended surgical endeavour during the past twenty-five years has changed this attitude towards tumours of the brain, and neurology is indebted to surgery not only for assisting in the treatment but also for awakening a new interest in the diagnosis of intracranial disease The need for early treatment of a steadily progressive lesion being self-evident, the early diagnosis of intracranial tumour was chosen as a suitable topic for discussion at the Belfast meeting of the British Medical Association, since it is to the general practitioner that we must look once again to make the first and the most important move in the management of the patient's illness What advice should be given to the family doctor to help him to bear this responsibility?

As Dr F M R Walshe has pointed out, headache is a common symptom of so many diseases that it is of little value as evidence of a brain lesion, but the suspicion that an intracranial tumour may be present should be aroused whenever there is a gradually progressive interference with *any* cerebral function If this alteration of function is associated with signs of raised intracranial tension the presence of a tumour is established, but even in the absence of such signs the practitioner should be suspicious enough to obtain the opinion of a neurologist, for it is the duty of the specialist to exclude the odd case of early paralysis agitans, and the like, which may mimic the first symptoms of a tumour This aspect of the diagnostic problem, from the general practitioner's point of view, is dealt with in greater detail by Dr Walshe, whose opening paper appears in the current issue of the *Journal*, while the problems which the specialist has to face are well set out by Mr Norman Dott

A profound change has taken place during the past ten years in the neurologist's attitude to ventriculography Since the early days, when the clinician had only his knowledge of anatomy and physiology to help in the elucidation of a difficult case, the special study of neurology has attracted the most learned physicians and those most richly endowed with intellectual gifts The accuracy with which brain lesions were localized won the admiration of their colleagues, and even if an error had been made at the bedside the brilliance of its explanation at the necropsy seemed oftentimes to have robbed the grave of its victory Everyone was satisfied, for it had been "an interesting case," and those inclined to be critical had to admit that, even if the tumour had been in the proper place, tragedy could not have been averted Surgery, however, demands more accurate localization than can be achieved by clinical examination alone, for instead of the physician's reputation it is the patient's life which is at stake, and knowing where to look for the tumour is often the most important factor making for success Neurology is thus doubly in debt to surgery, surgeons having devised the special methods of diagnosis upon which neurologists now rely for confirming the position of lesions which deform the ventricular system or alter the vascular supply of the brain It is only ten years since one of the greatest neurologists of our time stated that the aid afforded by ventriculography was required only in the case of the comatose patient, who was unable to co-operate in his examination, at the present day only the tumours which produce characteristic syndromes, or characteristic features on a plain x-ray film, are operated upon without preliminary ventriculography Nor is the value of this test confined to true neoplasms, for it has proved its worth in obscure cases of intracranial haemorrhage and suppuration

It is sometimes suggested that these special methods of diagnosis may be abused, to the neglect of adequate clinical neurological examination, but there is small likelihood that this will in fact occur In contrast to oral cholecystography and intravenous pyelography, for example, which can be ordered by a physician who may know little and interpreted by a radiologist who can know still less about the patient as a whole, ventriculography, cerebral angiography, and even the interpretation of plain radiographs and the examination of the cerebrospinal fluid can be undertaken only by those who have had special training in neurological technique Such a training, it may be argued, might tend to focus the attention too narrowly upon the brain, but all who have been privileged to work in one of the modern neurosurgical clinics which draw their inspiration from pioneers like Horsley, Cushing, and Foerster can testify to the emphasis which is laid upon painstaking clinical examination not only of the nervous system but of the whole patient.

This general examination is particularly important in providing an indication of the pathological

in combination with oestrogenic hormones and progesterone, has been carried out (3) the normal ratio of oestrogenic hormones to progesterone and to male hormones in normal women has been ascertained (4) the pathological disturbances of this ratio during endocrine and gynaecological disturbances in women have been discovered

Danger of Masculinization

Even if all the above criteria should be fulfilled another problem remains to be solved before the therapeutic application of sexual hormones possessing definite male properties can safely be started—namely the danger of masculinization. The cause of the natural occurrence of masculinity as a pathological condition in women may be understood better if the results of the experiments described above are taken into consideration. Our experiments have also shown that by the injection of some of the "chiefly male" hormones the rudimentary peri-urethral glands of female rats can be developed into a comparatively large and typical prostate and in the same way the clitoris like structure can be greatly enlarged. The supernormal development of these organs and the possible growth of a beard or moustache with the appearance of other signs of masculinity must be avoided in treating women. There is also the danger of a possible disturbance of the normal sexuality leading to the production of pathological perversions of sexual feeling.

These difficulties however can probably be overcome by working out the correct ratio of the male and female hormones. Experimental tests that might be suitable for this purpose are concerned with the development of the female preputial glands the clitoris-like structure and though technically more difficult, the "female prostate" in rats. But only after the completion of the whole scheme of investigation outlined above can the male hormones—and of them only those which are found to be normally present in women—be applied therapeutically with the object of restoring to normal the pathological hormonic ratios which will be found in certain diseases of women.

Summary

1. Bisexual properties have been found in nearly all the sexual hormones and the co-operative activity of most of them with oestrone or oestradiol has been demonstrated by experiments on female rats.

2. Suggestions are advanced as to the significance of these facts in regard to sexual physiology and pathology and in relation to the therapy of general sexual disturbances in females.

3. In the present state of knowledge however the results obtained in our experiments and by other workers do not in any circumstances justify the use of the bisexual hormones with pronounced male activity in the treatment of diseases of women.

Grants from the Medical Research Council and from the Lister Institute have enabled us to carry out this work. I offer my thanks also to Messrs. Schering Kahlbaum Ltd., in particular to Professor W. Schoeller for kindly supplying us with progesterone to Professor A. Girard for oestrone and oestradiol and to Messrs. Ciba Ltd., in particular to Dr. K. Miescher for all other hormones.

TREATMENT OF THE FEMALE CLIMACTERIC BY FOLLICULAR HORMONE

BY

H. R. DONALD, M.A., B.M., M.R.C.P.

Honorary Physician Manchester Northern Hospital Stretford Memorial Hospital and Royal Eye Hospital. Visiting Physician Crumpsall Hospital

Although some years have now elapsed since preparations of oestrin and its derivatives became commercially available considerable differences of opinion still exist on their clinical value. Since in my own case ignorance of certain principles underlying the administration of oestrin led at first to disappointment, and since further experience has convinced me of its unique value I feel that the following observations on its employment during the last three years in the treatment of disorders of the menopause may prove of general interest.

The climacteric is associated with the decline in the secretory activity of the ovary and a secondary rise in the gonadotropic secretion of the pituitary. Clinically these changes find expression in the diminution and ultimate cessation of the menstrual flow. Amenorrhoea by itself however must not be accepted as a reliable index of the menopause. On the one hand the endocrine changes which characterize the climacteric together with their secondary clinical symptoms may originate several years before the occurrence of menstrual irregularity. On the other hand amenorrhoea may not infrequently be due to causes other than ovarian, and in such cases the signs characteristic of the menopause, such as hot flushes, gain in weight, and nervous disturbances, may appear many years after the actual cessation of the menstrual cycle.

It will be well to emphasize once again the frequent occurrence of menopausal symptoms. In a group of 1,000 normal women investigated by the Medical Women's Federation (*Lancet* 1933, 1, 105) only 15 per cent. passed through the climacteric without symptoms. Of the remainder 62 per cent. suffered from hot flushes, 44 per

a certain ratio, facilitate or augment their individual effects If the ratio is altered the substances may antagonize one another Professor Korenchevsky also points out that oestrin and male hormone compounds have bisexual properties An interesting case was recently reported in these columns by Mr Harold Chapple,[1] in which a perfectly formed and beautiful woman possessed gonads which proved structurally and anatomically to be testes It is probable that the male hormone compounds secreted by these testes supplied the oestrogenic stimulus which resulted in the development of the female characteristics Professor Korenchevsky also refers to the fact that the administration of sex hormones may not only restore the physiology of the reproductive tract but also produce pathological changes such as cystic glandular hyperplasia of the endometrium or abnormally abundant development of the fibrous tissue of the myometrium (This suggests the possibility of an endocrine basis in certain cases of uterine fibroids) The danger of producing such pathological lesions by injudicious endocrine therapy should be carefully borne in mind

Finally it is important to realize that the administration of oestrogens, progesterone, and the androgens yields merely the temporary effects associated with substitution therapy Stimulation therapy can be achieved only by the administration of gonadotropic extracts Until recently only the luteinizing factor (prolan B) has been available for clinical use This is obtained from pregnancy urine extracts and is employed with varying degrees of success in cases of amenorrhoea, menorrhagia, habitual abortion, and cryptorchidism During the last year a preparation of the gonadotropic factor of pregnant mare's serum has been available for clinical trial This appears to contain the follicle-stimulating factor (prolan A), which should be more effective in stimulating the oestrogenic function of the ovary Mr Kenneth Bowes contributes at page 904 of our present issue a preliminary report on its effect in cases of amenorrhoea His results show that the menstrual rhythm may be restored for some months after the cessation of such stimulation therapy This substance is the latest adjunct to clinical research in hormone therapy, and in two or three years its value may be assessed

SULPHANILAMIDE IN GONORRHOEA

The treatment of bacterial infections with sulphanilamide and related substances was discussed last week at the Royal Society of Medicine (see p 928) when Dr Leonard Colebrook drew attention to some of the toxic effects that may arise Dr G A Buttle in an account of experimental work said that the gonococcus was as susceptible to sulphanilamide *in vitro* as meningococcus, and for the moment interest is focused on the possibility of treating gonorrhoea with this drug. Since the demonstration by Proom that sulphanilamide is effective against experimental infection with the meningococcus, it has been assumed for the purpose of therapeutic trial that the gonococcus is also susceptible and the truth of this assumption is now confirmed by Levaditi and Vaisman [1] These authors have succeeded in producing what appears to be true infection by the gonococcus in mice by the manœuvre suggested originally by Miller and Castles, and used by Proom in his work with meningococcus, of adding mucin to the inoculum On the clinical side there are now several favourable reports, to which another is added by Dr A J Cokkinis at p 905 of this issue It appears from his study that most cases both of acute and of chronic gonorrhoea respond rapidly to the treatment, while a few seem entirely resistant to it. It is not clear that this resistance depends altogether on the anatomical location of the disease and since the gonococcus is, serologically at least a heterogeneous species it may well be that resistance to sulphanilamide is a property of certain types of this organism This is one of several matters which await investigation, not the least of which is the later results of the treatment Dr Cokkinis's report, like others which have already appeared is of a preliminary nature Meanwhile, there is news from Germany of further progress in this direction Grutz,[2] having experienced complete failure in the treatment of gonorrhoea with prontosil, and moderate success only with prontosil album (sulphanilamide), reports successful clinical trials of four new compounds which are said to be of similar nature their actual composition is undisclosed and they are not yet available commercially It cannot be emphasized too strongly that treatment with sulphanilamide requires close and expert supervision, success is evidently dependent on heavy dosage which demands careful control if various toxic manifestations are to be avoided These according to numerous accounts include besides sulphaemoglobinaemia which is now almost familiar a skin rash and fever about the seventh day of administration, bone marrow changes leading to anaemia or even a fatal agranulocytosis and optic neuritis [3] These more serious effects are fortunately rare but it is nevertheless necessary when this drug is given that every facility should exist for their early recognition The possibility of self-administration envisaged by Dr Cokkinis when the public comes to recognize that gonorrhoea can be cured by swallowing tablets is alarming and the sooner sulphanilamide and allied compounds are scheduled as dangerous drugs the better Another warning appears necessary at this stage The constantly expanding sphere of useful application of this drug may easily lead to its being looked upon as a "cure all" for infections generally Although as Dr Cokkinis points out, it may have a remarkable effect in a great variety of conditions it must not be supposed that all cases of the diseases he mentions will

Presse méd Sept 29, 1937 p 1371

sthenic individuals in particular appear to derive but little benefit from oestrin in the presence of long standing psychic disturbances

When symptoms are mild the beneficial effect of even small doses of oestrin (3,000 international units, or 0·3 mg., of oestrone by mouth each day) is often immediately apparent Such patients not only profess to feel more composed and "consolidated' but not infrequently discontinue spontaneously a long standing barbiturate habit In all cases the dose of the latter which is necessary for sleep may be progressively reduced

2.—Vascular Spasm

In its tonic form vascular spasm may give rise to hypertension and possibly also to the characteristic angioneurotic oedema of the extremities, face, or trunk The latter condition responds quickly and favourably to oestrin administration, as observed in the following case

Case 1.—An unmarried woman aged 46 had had menstrual irregularity for six months and pain and a sensation of fullness in both forearms for two years, always occurring at night. *To obtain relief she has to lie with her hands above her head* and she feels that she would like to cut the finger tips and let the blood run out Both wrists are oedematous and stiff and there is a history of six months severe cramp across the chest on waking in the morning and six months muscular rheumatism There has been a great enlargement of the breasts during the last four years

All symptoms were rapidly and completely relieved by oestrone 1 mg. intramuscularly in oil twice weekly with 0·3 mg. by mouth daily Injections were discontinued after three months with no return of symptoms Now nine months after the starting of treatment, any reduction of 0·3 mg. of oestrone daily by mouth is followed by recurrence of retrosternal pain

The results obtained in cases of hypertension might be expected to be in proportion to its duration The following table gives the records of eight cases of high blood pressure

Case No.	Menopause	Blood Pressure at Start of Treatment	Duration of Treatment	Blood Pressure at Finish
44	Castration 5 yrs.	265/160	6 months	230/140
29	„ 3 yrs.	290/150	6 „	200/130
35	3 years	180/100	3 „	130/70
11	1 year	190/110	12 „	140/100
3	6 months	190/95	12 „	130/70
36	6 „	200/120	6 „	140/95
21	6 „	190/100	12 „	135/70
30	Now	180/100	3 „	130/70

It is important to remember that the symptoms associated with high blood pressure are due more to local vascular irritability than to the hypertension itself Even in those cases where owing to arterial degeneration, little reduction in actual pressure can be effected, complete relief of symptoms may be given

Case 2 (Case 44 in table).—A married woman aged 49 had undergone panhysterectomy in 1931, and had had severe headaches since the age of 33 Her condition before treatment was one of repeated vomiting, nervousness severe and frequent migraine attacks On examination her blood pressure was 265/160 and there was hypertensive retinitis and albuminuria The renal function was good

All headaches and vomiting disappeared after three weeks of oestrone administration, and have not recurred Now six months after commencement of treatment the blood pressure remains comparatively unaltered at 230/140 but the patient is symptom free on a weekly oestrone intake of 2 mg. intramuscularly and 2 mg. by mouth No fresh retinal haemorrhages have been observed and the urine is clear of albumin

The origin of hypertensive retinitis is not without interest High blood pressure itself does not afford a comprehensive explanation, and in many cases I would prefer to regard it as the local expression of an underlying vascular irritability I have recently observed a well marked "hypertensive' retinitis affecting the right eye only in a menopausal subject whose blood pressure was normal at 135/90 and in whom the renal function was good

Transient vascular spasm is of common occurrence When it affects the brain it may occasion migrainous headaches, transient and often recurrent hemiplegia (which in the presence of arterial degeneration may be followed by thrombosis, but which otherwise responds quickly to two or three capsules of amyl nitrite), grand mal and petit mal, retrobulbar neuritis, and spasm of the retinal vessels The typical attacks of giddiness may perhaps also be due to local ischaemia of the labyrinth, and the tinnitus aurium to a similar condition of the cochlea

Three cases of menopausal epilepsy received oestrin treatment, all of these patients had previously received luminal or prominal for a minimum period of six months The first patient suffered from major fits every three to four weeks On 0·3 mg. oestrone daily by mouth she has remained free for twelve months The second patient had two to four major fits every day For nine months she has received oestrone by injection and by mouth and during this time she has experienced transient attacks of dizziness without falling but on no occasion has she lost consciousness In the third case the attacks of major epilepsy were reduced by oestrin treatment from an average of four a week to one every fortnight

Case 3.—This patient a married woman aged 49 whose health had previously been excellent had a history of amenorrhoea for twelve months with headaches insomnia nocturnal "vasovagal attacks in which the heart would flutter like a wild bird vertigo and falling and oedema of ankles She was also gaining weight For six months prior to treatment this patient had experienced five attacks of transient hemiparaesthesia During one of these her right arm and leg became useless and her speech unintelligible for twenty minutes After three months on 1 mg. oestradiol benzoate intramuscularly on alternate days with 0·3 mg. oestrone by mouth daily, she was symptom free apart from occasional mild palpitations Now nine months later she remains well on a weekly dose of 2 mg. oestrone intramuscularly and 2 mg. by mouth There have been no recurrences of her cerebral symptoms

Similar transient spasm may also affect the viscera and extremities Spasm of the coronary arteries may give rise to spastic angina pectoris This latter process will further embarrass an already diseased heart muscle and the most gratifying results have followed the administration of oestrin to those patients whose old rheumatic carditis has undergone decompensation at the menopause

Case 4.—A married woman aged 52 had had rheumatic carditis since adolescence with amenorrhoea for three years twelve months insomnia headaches and depression and three months marked dyspnoea and oedema of legs and thighs On examination the apex beat was found to be 4½ inches out and there was auricular fibrillation with a pulse rate of about 130 ascites and a congested liver

She received out patient treatment For the first three months digitaline Nativelle 1/600 grain with luminal 1/2 grain night and morning together with 2 mg. oestrone intra

liver oil and even cream are considered to have been aetiological factors in some of the instances reported More care is urged in the case of sick and debilitated infants and in those suffering from neurological conditions such as those caused by birth injuries Mothers, it is stated, should be warned not to give cod-liver oil to struggling infants or to very feeble ones A large number of paediatric authorities are quoted to the effect that oily nasal drops should be prohibited for young children For the most part mineral oils seem to warrant most attention, and a safer medium such as a vegetable oil for the intranasal administration of such substances as menthol might be found One final point may be made—namely, has oil-aspiration pneumonia occurred in recent years in this country? The illustrations of Ikeda's paper clearly set out what the pathologist should look for, and the picture appears to be so definite that it is difficult to believe that such cases have in fact been missed

SPANISH INFLUENCE ON MEDICAL SCIENCE

During the present turmoil in Spain, where so much of historic interest has been destroyed by the contending armies, it is a relief to turn to the booklet published by the Wellcome Foundation on the occasion of the tenth International Congress of the History of Medicine, held at Madrid in the autumn of 1935 [1] This gives an excellent survey, illustrated by photographs of Spanish influence on the progress of medicine from the earliest times It is shown that in the Visigoth culture in the sixth century a prominent part was played by St Isidore, Archbishop of Seville and author of an encyclopaedia of all the sciences which is one of the chief books of the Middle Ages In the Hispano Moresque Renaissance of the tenth to thirteenth centuries the chief figures were Albucasis (1013–1106) author of a celebrated medico-chirurgical treatise, Avenzoar of Seville (d 1162) author of a famous surgical treatise, who described serous pericarditis pharyngeal paralysis, otitis media, and the itch mite Averroes of Cordova (1126–98), known as "The Commentator," whose system of medicine was based on a neoplatonic modification of Aristotle, and Maimonides also a native of Cordova (1135–1204) who as physician, philosopher, and theologian was one of the most eminent personalities of the twelfth century The Hispano-Moresque era was also remarkable for the erection of hospitals at Cordova, Toledo, Seville, and elsewhere, and the establishment of schools of translation of Arabian medical literature It is notable that Spain preceded other European countries in the foundation of universities with medical faculties and scientific libraries, as at Cordova Granada, Seville Malaga Almeria Barcelona Valencia, and Toledo The golden age of Spain which followed the discovery of America was marked by the appearance of many eminent medical men of whom the best known were Nicolás Monardes of Seville (1512–88), who made a practical study of remedial plants and was the first to describe balsam of Peru, and Francisco Hernandez (1517–87), physician to Philip II and author of a work on the natural history of Mexico and its relation to medicine In conclusion an interesting account is given of the discovery of cinchona, the tercentenary of which was celebrated at the Wellcome Historical Medical Museum in 1930, and of its introduction into Europe, where its general acceptance was not achieved until after fierce opposition

MEDICAL RESEARCH IN FEDERATED MALAY STATES

The report for 1936 of the Institute for Medical Research, Federated Malay States, is a further record of the valuable routine and research work of this institution In the division of malaria research, in addition to continued observations on the comparative merits of atebrin and quinine therapy, experimental testing of new remedies has been carried out A member of the Perak Medical Department has succeeded in producing a new form of quinine tablet combining the advantage of the sulphate in the matter of low cost and of the bihydrochloride in solubility and consequent therapeutic efficiency Tested on some fifty cases of acute malaria the new tablet was found to be at least as soluble as those of the bihydrochloride, while its therapeutic effect was similar to that of the same dosage of the bihydrochloride administered in solution Substitution of the new tablet for bihydrochloride tablets would entail a saving of £1,000 per annum for the Malayan Governments Experimental clinical, and epidemiological studies have established the identity of the rural form of tropical typhus with the tsutsugamushi disease Experiments in rabbits have shown that between strains of rural typhus and tsutsugamushi in these animals there is complete cross-immunity whether the route of inoculation be intra ocular, intraperitoneal, or intradermal and whether the criterion of reinfection be the development of ocular reaction, positive Weil Felix reaction, or dermal lesions Similar experiments with guinea-pigs and monkeys confirmed these results It is suggested that the term "rural typhus" should be discarded the typhus like diseases of Malaya being now reduced to two—the tsutsugamushi disease, almost certainly conveyed by mites and urban typhus, conveyed by fleas

The Canberra correspondent of the *Times* announces the resignation by Sir Colin Mackenzie M D F R C S, of the post of Director of the Australian Institute of Anatomy, which he has held since its foundation Many readers in this country will remember that during the war Sir Colin was consulting orthopaedist to the Military Hospital at Shepherd's Bush

The Nobel Prize for Medicine has been awarded to Professor Albert von Szent Gyorgyi of the University of Szeged Hungary, for his researches in connexion with vitamins A and C

it altogether The greatest care has been taken to exclude any psychological effect Such a factor is extremely difficult to keep out altogether, for the very attendance of the patients at hospital is in many instances sufficient to give them a suggestion of some benefit This has been avoided as far as possible by the use of control injections of olive oil and of tablets of similar size and colour In the majority of cases such a substitution was detected by patients in the first week, for they almost invariably experienced a return of their nervous tendencies and headaches

Points in Administration of Oestrin

Certain points concerning the administration of oestrin may well be mentioned

1 *Mode of Administration*—Two routes are available for oestrin replacement, the oral and the intramuscular The latter route is about five times as efficient as the former and hence considerably cheaper for hospital use The oral route, however, is effective even when large doses are required, and is the treatment of choice for the private patient The majority of the cases under review received a basic daily dose of 0 3 mg oestrone by mouth, any additional requirements being given parenterally

2 *Latent Period*—While very often there is immediate improvement in nervous tendencies and headaches the administration of oestrin must be continued for a minimum period of three months before its maximum effect can be observed This would appear to hold particularly true in the cases of articular rheumatism, hypertension and severe anxiety states In the early stages of treatment transient relapses may often be precipitated by infection or disturbances of environment

3 *Dose*—There is a wide individual variation in the optimum dose For mild symptoms such as nervousness, insomnia and flushes a dose of 0 1 mg oestrone (1 000 international units) three times daily by mouth may be adequate Seventeen of the first fifty cases became stabilized on this amount No smaller dose was employed, for it was found that equal benefit could be given to such cases by ordinary medical measures In twenty cases the initial minimal requirements have been 1 mg oestrone (10 000 I U) given intramuscularly in oil solution twice weekly, combined with 0 1 mg (1,000 I U) three times daily by mouth Ten individuals have required a dose of 1 mg oestradiol benzoate (10 000 international benzoate units)* intramuscularly two or even three times weekly, combined with the oral administration of 3,000 units of oestrone daily, while only three cases have required 50 000 benzoate units twice weekly for an initial period of four weeks at the beginning of treatment When any doubt exists as to dosage I have found the vaginal smear test of Papanicolaou to be of considerable assistance There would appear to be no direct connexion between body weight and dose but high doses are usually indicated in the hypersthenic, hypertensive individual with rheumatic symptoms

Duration and Cost of Treatment

Just as the daily requirements of oestrin vary with the individual, so also does the duration of treatment In five cases symptoms were relieved and the administration of oestrin discontinued in as short a time as three months. In the light of later experience discontinuation at that stage is often premature In sixteen cases it has been found necessary to continue the initial optimum dose for a period of three to six months, and in seventeen cases for six to twelve months before any reduction was possible In twelve cases reduction in dosage even after twelve months was followed by a return of symptoms In three of these reduction of dose after two years has been followed by a recurrence of headaches, cardiac symptoms or rheumatism In such cases it seems possible that the permanent administration of small doses of oestrin may be of benefit Recurrence of symptoms has occurred in one case twelve months after the termination of treatment Any reduction in dose must be effected gradually and over a long period of time It is my practice never to attempt such reduction until the patient has been symptom free for two months, when the dose is tentatively reduced by one-third No cases of tolerance to oestrin have occurred

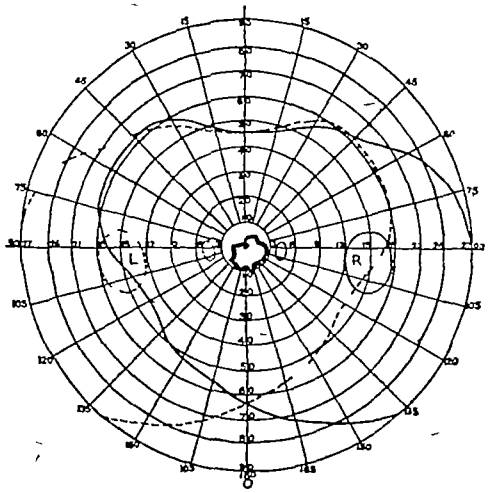

FIG 1—Case 6 Left perimeter chart on March 19 1936

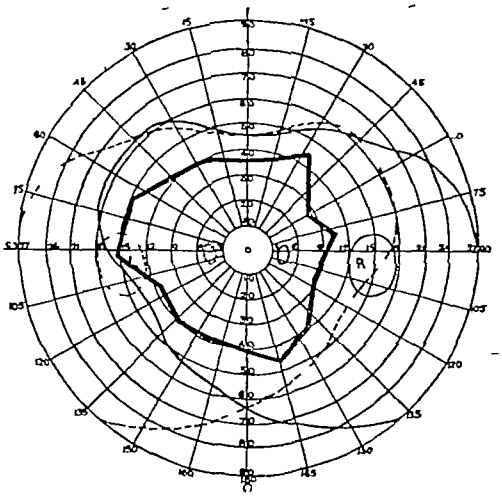

FIG 2—Case 6 Left perimeter chart on January 12 1937

The field of vision on both sides gradually increased to the extent shown by the above charts which were taken just before beginning and at the end of treatment with oestrone

* The international benzoate unit (I B U) is equivalent to five international units (I U)

exit instead of the inlet tube the anaesthetic will be blown over in liquid form, and the consequences may be unfortunate Where electrical apparatus is being employed in the mouth or throat it is preferable to drive the anaesthetic over by means of air from a bellows rather than by means of oxygen from a cylinder owing to the possible risk of an explosion In this connexion it should be mentioned that explosions have been caused not only by the cautery and diathermy electrode but also by the tiny electric-light bulbs on such instruments as oesophagoscopes or bronchoscopes when these bulbs have become loose or the insulation has been faulty

Closed Anaesthesia

Although open anaesthesia is easy to administer and requires the minimum of apparatus it is a wasteful method, for much of the anaesthetic is lost by evaporation into the surrounding air With a closed apparatus more accurate control is obtained and the amount of anaesthetic necessary is reduced. The simplest form of closed anaesthesia is by means of gas and air Apart from the cylinders of gas all that is required is a rubber bag, a face piece, and some form of stopcock containing valves whereby an occasional breath of air may be given This is, however, only suitable for minor operations, when longer anaesthesia is required with the addition of ether some other form of apparatus is needed

A very simple yet efficient form of closed apparatus is Clover's inhaler or the modified pattern known as Hewitt's wide-bore inhaler This consists of a closed container in which the ether is placed and through the centre of which is a passage-way for respiration By turning a lever part or all of the patient's breathing can be passed over the ether in to-and-fro respiration A face-piece at one end and a rubber bag at the other complete the apparatus As little as three to four ounces of ether an hour is required to maintain anaesthesia, and with a small stream of oxygen delivered under the face-piece patients keep a good colour and often stand an anaesthetic given in this way remarkably well.

Rather more elaborate are the various forms of apparatus for giving gas and oxygen with or without ether The simplest of these are the continuous flow machines, which in principle are rather like a Shipway apparatus with a flowmeter at one end and a rebreathing bag and a face piece at the other The flowmeters, by which the proportions of gases delivered may be regulated, are of two main types The older pattern consists of metal tubes which dip into a bottle of water and into which the gases flow A row of holes down the side of each tube allow the gas to escape The greater the flow of gas the greater will be the number of holes from which the gas bubbles In the more modern pattern the gases pass through upright glass tubes each containing a tiny bobbin, and as the flow of gas is increased so the bobbin rises and floats at a higher level in the tube The older type of flowmeter has the disadvantage that with the continuous flow of gas through the water a certain amount of water vapour is carried over, and this may tend to block the inlet tube in the ether bottle by turning to ice owing to the evaporation of the ether A jacket of warmed water placed round the ether bottle will avoid this The simplest and most popular gas and-oxygen machine is the Boyle's pattern, and it is either used in a portable form or is incorporated with the anaesthetic trolley Models devised by Magill and Ivor Lewis have in addition to the bottles for chloroform and ether, a hot-water chamber for warming the ether, a manometer, and an attachment to hold a sparklet bulb containing carbon dioxide, the whole being neat and compact In the intermittent-flow machines the gases flow from the cylinders when the patient takes a breath, and therefore the greater the degree of rebreathing the slower is the rate of flow of the gases Three models in common use in this country are the Walton, the Magill, and the McKesson, the last named being the most elaborate and efficient machine Any gas-and oxygen apparatus can easily be fitted with a closed circuit for carbon dioxide absorption if so desired

Equipment

Some practical points with regard to equipment may be of value to the practitioner who has to give anaesthetics

Cylinders—One of the drawbacks to any form of gas anaesthesia is the weight of apparatus that must be carried, most of it made up by the cylinders It is now possible to get steel cylinders which, though they are still somewhat expensive, are considerably lighter than those in common use Reducing valves must only be employed on cylinders containing the gas for which they are intended Thus valves meant for cylinders of nitrous oxide must not be used on oxygen cylinders, and they should be tested from time to time by the manufacturer Both cylinders and valves must be kept free from any sort of oil or grease

Face-pieces and Bags—All face-pieces are constructed with rubber pads to fit the face These are either pneumatic or of some form of sorbo rubber While the latter are more durable they are not so soft and yielding as the pneumatic pads, and when a really good fit is required, as in closed-circuit anaesthesia or when using a positive pressure, the pneumatic variety are more satisfactory A helpful piece of apparatus for holding the face-piece in position is the Clausen's harness This consists of a triangular sheet of rubber with each angle prolonged in the form of a strap containing a row of perforations It is placed at the back of the patient's head and the straps are brought forward and hooked on to a metal ring situated over the face-piece When properly adjusted it holds the face-piece firmly in position and leaves the anaesthetist's hands free for other duties, such as changing gas cylinders or taking the blood pressure Rubber gas-bags and rebreathing bags which have become stiff and perished through age and lack of use can temporarily be rendered more pliable by holding them in front of a fire for a few minutes or dipping them into hot water

Anaesthetic Agents—Unless a practitioner administers anaesthetics frequently a large supply of ether or chloroform should not be stored as these drugs are apt to deteriorate, particularly if not kept in the dark The bubbling of air or oxygen through ether also tends to cause decomposition, but the presence of metallic copper will help to prevent this Many of the ether bottles in anaesthetic apparatus have their internal fittings made of copper, and one firm of chemists even nails a small piece of copper foil on the under surface of the cork in the ether bottle Ether through which air or oxygen has been bubbled should not be kept in the bottle until such time as it is required again unless the interval is short Stale ether need not be wasted, as it is an excellent cleaning material it will, for example, remove paint or grease from the hands with ease The standard of purity of ether and chloroform as supplied by the various manufacturing firms is extremely high and all brands appear to be equally efficient in producing anaesthesia While the same is true of ethyl chloride each brand appears to have a

were no premenstrual changes in the stoma Injections were given for another six weeks when menstruation was regular the periods lasting four days The uterine cavity measured 2½ inches in length and the body of the uterus was definitely larger on palpation Following discontinuance of the injections periods have continued spontaneously It is now three months since the last injection was given.

Case 2—A married woman aged 26 The periods started when she was 15, and were of a twenty-day cycle with excessive loss until marriage, one year before she came to hospital Since marriage the loss had markedly and progressively decreased lasting only one day and needing merely one pad With injections the loss increased the next period needing two pads the following one lasted two days four pads being used the next, five pads and the subsequent two six pads Injections were stopped and she has since had a four-day normal period spontaneously

Case 3—An unmarried girl aged 18 who complained of irregular menstruation The periods had started when she was 16½ years old and had never been regular the interval varying between three weeks and three months. The previous period had been two months before she came to hospital and the preceding ones at three months intervals The uterus was rather small There was no result from the injections until she had had twelve when a period occurred This might obviously have been her "normal" period However the next came at five weeks interval and injections were stopped The following period was at four weeks interval and came on spontaneously

Case 4—A married woman aged 27 The menstrual history was that, following irregularity at the onset when 15 the periods had been regular until a few months previously The periods then became a fortnight late and finally there had been three months amenorrhoea without pregnancy The uterus was of normal size Regularity was established with antostab In this case the endometrium on section showed evidence of luteinization prior to the use of the antostab

Case 5—An unmarried woman, aged 21 Amenorrhoea had persisted for one year menstruation having started at 16 with some epimenorrhoea Antostab was administered without avail curettage showed very little endometrium in a resting phase

Curettings in the above cases were obtained by a small tube strip-cutting curette, which can be inserted into the uterine cavity without an anaesthetic or under evipan It is similar to that described by Herell of the Mayo Clinic and is easier to use than the suction type The strips are cut on the return stroke they are retained in the lumen of the tube and can be washed out By this method successive observations can be made on the same patient

Commentary

It is clearly impossible to draw any valid conclusion from such a small series of cases over so short a duration of time However, the results seem to be sufficiently hopeful to justify mention The microscopical findings in Case 1 point to the antostab having a definite action in producing endometrial changes via the ovary The difference between the result in this case and in Case 4 may be due to the fact that Case 1 is not producing enough prolan B to give rise to luteinization whereas Case 1 is doing so herself Obviously the indication is to try the use of prolan B as well in such a case This has not yet been done, as it was desired to see if the menstrual flow would continue spontaneously The fact that it is not possible to tell by clinical means alone the true nature of menstruation produced by any hormonic preparation points to the value of the curette as an aid to treatment

My thanks are due to Messrs Boots Pure Drug Co Ltd who kindly provided me with supplies of "antostab" for clinical use

TREATMENT OF GONORRHOEA WITH ORAL SULPHANILAMIDE

TECHNIQUE, TOXIC EFFECTS, AND EARLY RESULTS IN 250 CASES

BY

A J COKKINIS, M B, B S, F R C S

Assistant Surgeon Wembley Hospital Assistant Director, Special Clinic and late Assistant Director Surgical Unit St Mary's Hospital

It is becoming increasingly obvious that the discovery of the sulphanilamide or prontosil group of drugs is an outstanding event in medical history Its possibilities are greater than was at first thought, and several organisms have now been shown to be susceptible to its action In the space of a few months I have seen it effect surprising improvement in such unrelated conditions as acute cholecystitis throat infections, appendix abscess, suppurative arthritis, infections of the urinary tract, subphrenic abscess, septic compound fractures, and diffuse peritonitis Others have testified to its efficiency in puerperal sepsis, *B coli* infections, and meningitis Sulphanilamide is by no means infallible, indeed one is soon struck by its capriciousness of action, even in infections caused by the same organism But when it does show a therapeutic effect that effect is astonishingly potent and unprecedentedly rapid

Unfortunately these drugs are definitely toxic, and although most of the unpleasant effects are fleeting and of little consequence, evidence is accumulating which suggests that serious and even fatal disorders sometimes result from their use There is a grave risk that the therapeutic potency of these substances will lead to their being employed more and more extensively, and in larger and larger doses before their dangers are properly appreciated, and that a crop of disasters may follow which will throw discredit on a valuable discovery For this reason one of our first tasks must be to find what these dangers are and how they can be guarded against In a thoughtful if rather pessimistic article just published Jennings and Southwell Sander (1937) emphasize that drugs of the sulphanilamide group are potential marrow poisons and point to the occurrence of a number of cases of agranulocytosis with ulcerative pharyngitis and of haemolytic anaemia Cases of optic neuritis have also been described and I have seen one myself But whilst we must be duly aware of these and other dangers and be constantly on the look out for their earliest manifestations, I hope to show that any serious risk can be abolished if the treatment is carried out under proper control

After the discovery that sulphanilamide was an effective destroyer of the meningococcus it was inevitable that attention should be turned to the closely allied but much more widespread gonococcus The treatment of gonococcal infections hitherto has been so thoroughly unsatisfactory that when the first reliable evidence of successful results (in nineteen cases) was reported by Dees and Colston (1937) it naturally induced many others to follow in their wake and to give the drug a trial Owing to the lack of adequate knowledge and experience of the new therapy it is not surprising that very different results have been obtained, and indeed published by some workers No greater discrepancy could exist than that between the article published by Surgeon Commander Crean (1937) and the letter by Dr Anwyl-Davies (1937) which appeared in the *British Medical Journal* a few

lation It should not be allowed to come into contact with the air

Further investigations should be directed to the following points (1) The comparative value of fresh blood (pure or stabilized), stored blood, defibrinated blood, and even blood substitutes (2) The comparative value of anticoagulants (3) The length of time for which blood can be stored (4) The comparative value of stored blood and fresh blood for the purpose of immuno transfusion (5) The utilization of the residual plasma

Haematological Problems

Stress was laid by the committee on the sensitiveness to transfusions of patients suffering from blood diseases, and it was urged that every precaution must be taken to ensure compatibility Blood transfusion might be indicated in the treatment of pernicious anaemia, but its value was doubtful and it was not always free from danger in the treatment of the leukaemias The most beneficial effect of transfusion was seen in the erythroblastoses of infancy It was considered that transfusion was also useful in haemophilia, and that it should always be given before an operation on a known haemophiliac Small transfusions of 50 to 100 c cm repeated at fortnightly or monthly intervals were recommended In patients with a haemorrhagic diathesis blood transfusion was only a palliative measure Transfused blood was also recommended as a haemostatic agent in the treatment of the haemorrhagic syndrome of infectious diseases

The committee stressed the point that the value of transfusion in the treatment of blood diseases in general could only be ascertained when precise details were given in the case reports These should include a complete examination of the blood and of material taken from the haemopoietic centres The case history should include particulars about the heredity, past history, and occupation of the patient

Questions of Organization

The organization of blood transfusion services had been highly developed in large urban centres, in some of which it was under the direction of an independent society or philanthropic body, in others the service was organized by the Red Cross The growth of these services was indicated by the increased number of transfusions that were being done yearly Conditions in rural areas, however, were not always satisfactory, but it was hoped that the example set in the large towns would be followed in smaller centres and that transfusion services would be built up by the recruitment of carefully selected donors In the meanwhile the committee drew attention to the advantage which rural areas would gain from a transfusion service based on the storage of blood There should be no practical difficulty in carrying this out if the support of public authorities were obtained

The committee also spent some time in considering the organization of a transfusion service in time of war Here again the question arose of using stored blood, although it was admitted that the transfusion of fresh blood was the ideal to be aimed at It appeared logical to choose the donors from the army medical services attached to the units at the front Stored blood might be collected from the civilian population

The committee recommended that the organization of transfusion services within the Red Cross should be developed and extended In any case improvisation must be avoided Among the desiderata were careful choice and periodical examination of the donor, technical skill in making the transfusion, which should be given at a transfusion centre (it was thought that many accidents were due to inexperience) and, lastly a strictly scientific method for the determination of blood groups—in this connexion it was pointed out that commercial sera were not always equally reliable that errors in grouping were not unknown, and that a careful check for re examination would be valuable

General Remarks

Many delegates emphasized the need for careful selection of donors in order to avoid the risk of venereal infection A case was mentioned of a donor who, twenty-four hours after receiving a negative Wassermann report, transmitted syphilis to the recipient of his blood Nearly every country outside Great Britain insists on the frequent re-examination of donors, who have to have identification cards with photographs and records of examinations and transfusions The British system of voluntary donors was looked upon as hopelessly Utopian in most other countries, and the statement that the cost of the London service worked out at less than eight shillings a case was received almost with scepticism The British system was criticized as subordinating the interests of the patient to that of the donor

The technical medical problems discussed can be con of blood, with a minimum payment of 20 dollars, from which 6 dollars is paid to the bureau Donors have to be submitted to a physical examination within three weeks before each transfusion In Paris 100 francs is paid for the first 200 grammes, rising by 50 francs for each successive 100 grammes, the donors must be prepared to serve at monthly intervals and to be re-examined every three months Although it was considered advisable to employ donors of the same group as the recipient, it was evident that subjects belonging to group 4 (O) were being used almost exclusively as donors

The technical medical problems discussed can be considered in greater detail when translations of the various papers have been made Of these the possibilities of blood storage suggest the most profitable lines for future investigation and experiment

THE ART OF BIOGRAPHY

LLOYD ROBERTS LECTURE IN LONDON

Mr Philip Guedalla, in his Lloyd Roberts Lecture, which was delivered at the house of the Royal Society of Medicine on October 29, resisted the temptation, which he said was always felt when addressing the members of another profession, to parade the lecturer s fragmentary knowledge of their work He took instead a subject from his own domain, that of biography The biographer s problem, he said, was the opposite of the doctor s, in that he started with a dead man and, if he knew his business, ended with a live one The late Sir Edmund Gosse, the first Lloyd Roberts Lecturer in 1923, had in his article in the *Encyclopaedia Britannica* defined biography as "that form of history which is applied, not to races or masses of men but to an individual The biographer's duties were the same as those of the historian to provide an accurate reconstruction of the past using the same method and the same body of evidence, and testing the evidence by the same rules, but whereas the historian took as his period usually the life or some phase of the life of a State, the biographer was limited between the dates of the birth and death of his subject The biographer s path lay between two tempting fields—pure literature on the one hand and psychology on the other The temptation to make psychological digressions was an insidious one, especially as there had been an enlargement of curiosity on this subject in the present generation Our fathers were satisfied with the record of a man's public doings, but the modern reader wanted to know what manner of man he was To take the most massive example of modern biography, Morley s *Gladstone* there one had an impeccable record of Gladstone s activities but no portrait whatever of the amazing old man, half dynamo and half major prophet In Gosse s article already quoted it was said that true biography was ' the faithful portrait of a soul in its adventures through life But this was only possible if the subject had been obliging enough to put on paper a self-revelation when he had

odd mucous thread) Usually this occurs in two to six days but the large doses are not continued beyond the first week, even if symptoms and positive smears persist The quantity is now diminished to six tablets (3 grammes) daily for one week and then three tablets (1 5 grammes) for another week, making a total period of about seventeen to twenty days Older or undersized men start with 3 grammes daily, but provided they show good tolerance the dose is increased to 4 grammes if the symptoms do not clear up rapidly Each patient is told to report immediately toxic symptoms develop, and is seen at least two or three times a week, the group on irrigations of course attend daily (a definite advantage) Smears are examined whilst any discharge is obtainable Cases with toxic symptoms are carefully investigated and when advisable, spectroscopic and cytological examinations of the blood are made Sometimes it is necessary to cut down the dosage for a short period or even to abandon the treatment but mostly either the symptoms are too trivial to justify this or the patient acquires tolerance to the drug after a few days

2 *For Gonorrhoea with Complications*—Cases of posterior urethritis, or what is more properly a trigonitis of the bladder, on the whole react quite well to the above routine as do most patients with gonococcal arthritis, fibrositis and eye conditions But cases of prostato-vesiculitis and epididymitis have proved extremely capricious Whilst the above technique is effecting remarkable cures in some of them, in others it is doing little or nothing To a group of the latter I am applying what might be termed an "interrupted shock technique with some success giving very large doses (up to twelve tablets, or 6 grammes daily) for two or three days at a time with equal or longer intervals on much smaller doses or on none at all and repeating the cycle two or three times When a case is not responding satisfactorily after two weeks at most the sulphanilamide treatment is abandoned

3 *For Cases of Chronic Gonorrhoea (Morning Gleet, Recurring Slight Discharge etc)*—We give these only 3 grammes daily for seven to ten days and 1 5 grammes for a similar period, with results which are almost uniformly successful.

4 *For Cases with Non Gonococcal Urethritis Prostatitis or Cystitis*—These are treated with the same doses, but a cure can be expected in seven to ten days In this and the previous group irrigation is quite superfluous, but alkalization of the urine seems to be of real value

Tests of Cure

These are rigorous and of course are only applied to gonococcal cases At the end of the sulphanilamide course (seventeen to twenty days) all treatment is suspended Prostatic bead and complement-fixation tests are taken now and repeated if necessary Four to seven days later a urethroscopy is done and the whole urethra is massaged on a full sized metal bougie At the same time a provocative injection of vaccine containing 200 million gonococci is given (provided the complement-fixation test is negative), and the patient is allowed alcohol The patient attends next day the urethra urine prostate and vesicles are examined and another bead test and urethroscopy done if necessary If all is well the patient returns in a week and is again examined The tests of cure thus occupy about two weeks during which the patient is having no treatment whatever and is leading a normal life All cases that have passed their final tests are placed on a follow up list and will be seen periodically for at least two more months

Toxic Effects of Sulphanilamide

The property of sulphanilamide which has interested me above all others is the almost bewildering variety of toxic effects it can produce Most of them are of little consequence, but some are serious These effects vary with the amount ingested and the measures taken to avert them but even more with the general health and natural susceptibility of the patient Some are able to take the largest doses without turning a hair" A few are so intolerant that the first gramme or two make them seriously ill The great bulk however, show some toxic reaction—more or less disagreeable, but rarely sufficient to demand interruption of the treatment

The most serious effect of sulphanilamide appears to be depression of the haematopoietic functions of the bone marrow, and several cases of agranulocytosis and haemolytic anaemia have already been described To these we must now add optic atrophy and as experience accumulates other serious dangers may become apparent What constitutes a dangerous quantity of the drug is not yet established, but we know that it is variable and that it depends on the general fitness and idiosyncrasy of the patient We also know that prolonged administration and the total amount given are of greater toxigenic significance than the size of the individual dose

In this large series of 250 cases we have thus far been particularly fortunate in our immunity from really dangerous consequences, although in view of the experience of others, we await the future with some concern To a large extent this immunity can be attributed to (i) the strict limits within which we keep our total dosage and our period of continuous administration (ii) the measures we adopt to combat the toxicity of the drugs (for example, ingestion of large quantities of fluid, administration of glucose—in the form of barley sugar), and avoidance of sulphur-containing foods and aperients, (iii) the anxious care with which we look for signs of real danger such as extreme pallor, persistent vomiting, ulceration of the mouth and throat, rigors, deep cyanosis serious dyspnoea, or loss of visual acuity, in the face of any of which it would be folly to persist with the treatment On the first appearance of any of these symptoms or of other markedly toxic manifestations the sulphanilamide is suspended and the blood examined for the spectra of methaemoglobin or sulphaemoglobin and cytologically for evidence of leucopenia and immature red cells

Gonorrhoea may at times be a serious disease but it cannot be justifiable to expose its victims to dangerous levels of treatment although such risks may properly be taken in graver and more fatal conditions It is my considered opinion that a patient with gonorrhoea should never be given a total quantity of more than 60 or at most 70 grammes of sulphanilamide and that the period of administration should never exceed twenty one days

The less serious toxic effects I have seen in great number and variety but only passing reference can be given to them on this occasion The more distressing are intense nausea occasional vomiting giddiness and persistent headache (usually frontal) Other subjective effects not uncommonly seen are anorexia constipation lassitude, chilliness a sensation of weakness and a type of malaise which several patients describe as feeling punch-drunk Many complain of exhaustion and slight dyspnoea on muscular effort, of being out of sorts or of not being able to think clearly An interesting syndrome I have seen is loss of memory with deafness and severe headache, another is loss of the taste for tobacco and alcohol

Hungarian Government, which followed a special ballet performance at the opera house

After the closing session of the Congress the delegates were taken on a two day tour of North-Eastern Hungary, visiting the delightful little baroque cathedral town of Eger which is about ninety miles from the capital, and a well known mountain health resort named Lillafüred in the Tokay district, where they were given full scope to examine the various wines for which that part of the country is justly famous

On returning to Budapest a wreath was laid by the national representatives on the statue commemorating the great Hungarian physician Semmelweis, the first man to discover the infective nature, and to advocate successful prophylaxis, of puerperal fever

The majority of the medical delegates then left to attend the annual meeting of the International Society of Medical Hydrology, which was to be held at Wiesbaden, under the chairmanship of Dr E P Poulton (London) and the presidency of Professor Vogt of Breslau, from October 16 to 22

SOCIETY OF MEDICAL OFFICERS OF HEALTH

THE PRESIDENTIAL ADDRESS

On October 29 Dr James Fenton, medical officer of health for Kensington, delivered his presidential address to the Society of Medical Officers of Health

Dr Fenton said that from 1847, when the first medical officer of health in this country was appointed, until the end of the last century medical officers of health had been occupied in laying such foundations of the present public health structure as wholesome water supply, sound drainage and sewerage systems, and public hygiene, as essentials in fighting the great epidemics which were then rife To-day the sanitary services were largely in the hands of water engineers, civil engineers, and cleansing superintendents Since 1900 the medical officer of health had been able to direct his attention to the more technical details of the prevention of disease, and had been engaged in introducing the school medical, tuberculosis, maternity and child welfare, and venereal disease services The Ministry of Health, under the Local Government Act of 1929, transferred to local authorities much of its own responsibility for the initiation and development of preventive measures This Act also transferred all Poor Law functions to local authorities and gave the medical officer of health new responsibilities in regard to hospital administration There was now a growing tendency for municipal hospitals to direct their efforts to the preventive aspects of medicine

The Health Services

In 1900 the money spent on social services in Great Britain amounted to 19s 2d per head of the population, the figure was now about £9 per head That people did not fully appreciate what was being done for them by the public health services was obvious from the facts that only 48 per cent of expectant mothers visited ante-natal clinics, only 60 per cent of the children born attended the infant welfare centres during the first year of life, only 64 per cent of the children found at school inspections to need dental treatment received such treatment, and a large proportion of cases of tuberculosis were not notified to the medical officer of health until after death The lack of this appreciation Dr Fenton continued, led his own borough council in 1925 to appoint a health lecturer on the staff of the public health department It had not been, however easy to organize lectures or to persuade people to attend them, and the health lecturer, therefore, had given talks in the waiting-rooms of clinics and centres and in the out-patient departments of hospitals

Education in Health

In May, 1923, the Society of Medical Officers of Health, in a letter to the Ministry of Health, stated that in its view it was imperative that recent knowledge of the effect on health of food, exercise, fresh air, sunlight, etc, should be brought to the notice of the public "Public health education," the Society said, "is the cheapest and probably the most effective of all forms of public health work In 1925 a deputation to the Minister stressed the urgent need for further propaganda directed to the general improvement of health rather than to the combating of special diseases it thought that statutory provision should be made for local authorities to carry on health education In 1927 the Central Council for Health Education was established and, after ten years of experience, proposed to the Minister that a national campaign should be conducted to encourage a greater use of the health services the campaign began in September of this year One of the objects of the campaign was to arouse public interest in the work of assistant health officers In each public health department, Dr Fenton said, there should be created a well defined scheme of health education Every contact made with the public by the medical officer, the health visitor, the sanitary inspector, and the office clerks had a potential educational value Great steps had been made in the application of physical sciences, but human biology had lagged behind

The Problem of Rheumatism

There was an urgent need for directing attention to rheumatism, especially as in the future there would be a greater percentage of people in the age groups in which rheumatic disorders were prevalent Even to day rheumatism was probably the greatest single scourge of this country, and it was a matter of interest that a number of well known persons had established the Empire Rheumatism Council In his annual report for 1935 Sir Arthur McNalty had stated

"The principal requirements for any reduction of the great industrial morbidity from the chronic rheumatic diseases may be briefly summarized thus (1) research into causation, (2) investigation of the comparative value of the widely different therapeutic measures, (3) increased provision of the various forms of physical treatments, which cannot be provided by the ordinary practitioner and (4) increased in patient accommodation, especially in the form of research units in hospitals"

Until the eradication of this disease became the concern of the State, it was to be hoped that voluntary organizations would receive as much municipal support as was necessary to carry out the requirements outlined by Sir Arthur McNalty

Referring to the question of child guidance, Dr Fenton said that psychiatric clinics, mostly under the direction of voluntary organizations, had been established, but their value had not yet been fully recognized Delinquency, behaviour difficulties, nervousness, speech difficulties, truancy, and habit spasms resulted from maladjustment in regard to which a psychiatrist was able to suggest suitable treatment, for this reason child guidance should be transferred from the sphere of education and sociology to that of the medical services

---

The sixth annual report of the Paris Pasteur Institute states that of the 118,000 persons who received anti-rabies treatment in the different Pasteur Institutes in 1933 only 408 (0 35 per cent) died Most of the cases occurred in the East and especially in India In Europe the countries most affected with rabies are the Balkans, 8,248 cases were treated at the Pasteur Institutes in Yugoslavia, 1,776 in Athens, 1,740 in Istanbul, 2,844 at Budapest, and more than 2,000 at Warsaw The highest mortality was caused by rabid wolves—namely, 11 2 per cent—as compared with 0 33 per cent caused by mad dogs and 0 03 by cats

Alkalization of the urine certainly seems to enhance the bactericidal action of the drug in chronic and non-gonococcal cases, and to a lesser extent in acute ones. Also I think better results in acute cases are obtained with urethral irrigation than without it. Vaccines and antitoxin on the other hand seem to be superfluous in cases which respond to sulphanilamide. These and other questions are still being investigated.

Conclusions

1. An intensive trial with sulphanilamide has proved conclusively that we now possess an effective remedy for gonorrhoea and for most of its complications. The drug is able to produce a clinical cure in a large majority of acute and chronic cases in a week or less. There is good reason to believe that by a rational administration extending over two to three weeks nearly all the clinical cures can be converted into permanent ones. Unfortunately a small group of cases completely fail to respond to the treatment.

2. Although the drug can be conveniently given by the oral route, as has been done in this series it is emphatically not the answer to the general practitioner's or the patient's prayer for a 'tablet' that will cure gonorrhoea. There is far more in the sulphanilamide treatment than the mere giving or prescribing of a box of tablets.

3. The drug is intensely toxic and its toxicity depends not only on the amount taken but also on the period of continuous administration and on the general condition and individual tolerance of the patient. Most of the toxic effects are unimportant, others temporarily distress or incapacitate the patient, but there are some which actually endanger life. Patients often develop an acquired tolerance to the minor toxic effects and measures can be taken to combat the toxicity of the drug, but at the first sign of real danger its administration must be stopped at once.

4. To obtain optimum results the drug has to be given in *potentially toxic amounts*. Its administration should therefore be entrusted only to those who understand its dangers and know how to assess the toxic symptoms and signs. Facilities for periodic examination of the blood, cytological as well as spectroscopic, must be at the immediate disposal of administrators. With such knowledge and facilities and by strict limitation of the total quantity and period of treatment the administration can be made as safe as it is efficient.

5. Owing to the uncertainty which must for a time prevail as to the permanence of cure final tests must be particularly vigorous and patients should be kept under observation for a considerable period.

6. Finally one would issue a warning to official quarters against the dangers that would arise from indiscriminate sale and purchase of this toxic drug once the lay public becomes thoroughly aware of its existence and effectiveness.

A Dutch family has recently offered prizes for the best answers to the question What are the best methods for preventing or diminishing the dangers of thrombosis and embolism after childbirth and operation? The first prize was awarded to Dr J Stroink of Utrecht in collaboration with Dr Patersson of Pretoria and the second prize to Dr H. Festen of Thilbourg.

Clinical Memoranda

Chorion-epithelioma associated with a Living Child

The following case seems interesting enough to place on record.

Mrs X aged 37 married ten years, had had a miscarriage at three months eight years ago and was curetted. She had a living child (forceps delivery) seven years ago. Her last period was on October 31 1936.

During January 1937 the patient developed severe vomiting, for which she was admitted to hospital for one week when it ceased. On February 17 a vaginal loss started, pale and slight in amount, but persistent. She was in bed for seven weeks and then gradually got about again but the loss continued for the remainder of the pregnancy. From March onwards the uterus was about a month larger than was expected according to the date of the last period. At the beginning of May she developed a heavy cloud of albumin in the urine with marked oedema of the legs, and her pallor became more noticeable.

Owing to the large size of the uterus she was examined radiographically on May 22. This showed one foetus (vertex) and confirmed the findings on abdominal palpation. On May 26 and again on the 28th, she had a brisk bright uterine haemorrhage. On the latter date vaginal examination showed the os dilated to the size of a shilling and within it a boggy soft mass. This was thought to be a placenta praevia and she was removed to hospital. Caesarean section a few hours later produced a living child of 3¼ lb. weight and a large hydatidiform mole. The pathological report on this latter indicated a tendency to malignancy and a month later when the patient was in a fit condition a total hysterectomy was performed. At the fundus of the uterus a soft mass was found and this on section proved to be a chorion-epithelioma.

The patient made a rapid recovery and is at present in excellent health. The infant survived for nine days.

Melton Mowbray MARY C ELLIOT

Nasopharyngeal Teratoma

The literature does not contain many reports of teratoma of the nasopharynx. Hankins and Harding (1932) found only three cases in a review of the literature of ten years, to which they added one of their own. The rare occurrence of such conditions seems to be sufficient justification for the publication of the following case report in the hope that it will add something to the knowledge of this rare tumour.

CASE REPORT

A female infant three weeks old was admitted to the City Hospital for Infectious Diseases Newcastle upon-Tyne with the diagnosis of ? laryngeal diphtheria. On admission she was seen to be a rather poorly nourished child—not unduly distressed but showing a definite "sobbing" or interrupted type of inspiration. There was no recession or other evidence of laryngeal obstruction and no aphonia but there was a purulent nasal discharge. The fauces showed small white patches suggesting that the child had been fed recently. The heart sounds were normal the percussion note had not altered the air-entry was satisfactory on both sides and there were no adventitious sounds. The history was that the infant had been blue at birth and difficulty had been experienced in establishing lung breathing. There had always been a thick yellowish nasal discharge but this was never blood stained. At no time had the infant taken the breast or the bottle well. For a day or two before admission attacks of difficult breathing, with blueness had been observed.

enabled more urea and alkali to be excreted This infusion could be repeated twice a day if necessary, and the blood urea should be estimated every day or every other day

Surgical Indications

Mr G GORDON-TAYLOR mentioned the use of gum acacia solution, introduced during the war, and still described in the most recent textbooks of surgery His impression of it was very unfavourable With regard to hypertonic saline, no doubt there had been good results in the treatment of ileus One class of case in which bicarbonate of soda solution might be extremely beneficial was post-transfusion reactions in which the patient developed haemoglobinuria—cases very rare nowadays He had certainly saved the life of a patient suffering from suppression of urine by infusion of bicarbonate of soda One indication for the use of saline was sudden loss of fluid from the blood vessels The proper substitute for blood was blood, but there were times when blood might not be available at a moment's notice, and the use of saline or glucose was most valuable as an emergency measure Perhaps intravenous therapy was most useful of all in duct obstruction associated with jaundice Glucose was a sheet anchor in the preliminary treatment in such cases There was always the danger that the success of intravenous therapy might lead to excessive zeal in its use

Dr H I COOMBES gave a demonstration with various forms of apparatus, illustrating safe and convenient use The site of injection was usually the ante-cubital fossa, though the inside of the forearm, given convenient access to a vein, might be useful, and for prolonged treatment the saphenous vein near the malleolus might be taken He also showed how in an attaché case sufficient apparatus might be contained to provide for transfusion, taking blood from the donor and giving it to the recipient, or to give an intravenous glucose solution From 3,000 to 4,000 c cm a day was a most useful quantity for saline infusions

Professor L J WITTS suggested that to give 3,000 c cm of a 0.9 per cent solution of sodium chloride a day, in view of the limitation of diseased kidneys in concentrating saline, was to run the risk of a very large surplus of saline in the body Dr W TREVAN thought the question of saline *versus* Ringer to be settled on theoretical grounds in favour of Ringer If an excessive amount of sodium chloride was going to be put in, there ought to be the salts to balance it, unless one knew that there was a definite deficiency of sodium chloride and not of other salts

Sir JAMES WALTON said that as he grew older he feared more and more the intravenous infusion, not of blood, but of saline and glucose, and it was interesting to hear from the scientific side also that there was some doubt as to the value of these big doses Where there had been an acute loss of fluid all would be agreed that fluid must be given, but even there his clinical experience suggested that a small amount was as much as could really be advantageous He believed rectal administration to be most satisfactory If the fluid was required it was absorbed by the rectum, and if not required it was returned More and more he was convinced that large quantities of fluid given intravenously turned the scale, not in the patient's favour, but against him

Tropical Conditions

Dr P H MANSON-BAHR said that in tropical medicine there was one condition in which all the indications were for intravenous medication—namely, cholera Recent work on cholera seemed to show no advantage in hypertonic saline It was introduced by Rogers on the assumption that the fluid would be retained in the vein, and not filtered out into the tissues All recent workers on cholera had come round to the idea that normal saline, not hypertonic, ought to be given It was very desirable to have the amount of saline excreted in the urine in cholera estimated by modern biochemical methods, though he did not know how that was to be done, short of sending a biochemical unit to Shanghai In blackwater fever an enormous haemolysis took place very rapidly, and here again intravenous therapy had come into prominence By giving intravenous sodium bicarbonate in hypertonic solution the blocking of the kidney with methaemoglobin was to some extent prevented, with the anuria which caused the death of the patient

Dr H L MARRIOTT mentioned the large amounts which might be introduced by rectum The largest amount in his experience had been twenty-three pints per day per rectum, this was in a very dehydrated patient, but there had been no difficulty in getting in twelve pints Dr DONALD BATEMAN said that the counterpart to cholera in this country was the acute gastro-enteritis of infants, the treatment of which had been revolutionized by the introduction of intravenous saline Previously there had been only three methods of treating it continual small doses of fluid by mouth, subcutaneous administration, and a single infusion of fluid into a vein Each had its disadvantages, but with the continuous intravenous method with small doses of fluid the child could be kept going for quite a long time Dr A A OSMAN spoke of the value of this treatment in cases in which there were varying degrees of renal failure He was not quite sure of the expediency of using the intravenous route He preferred the rectal method if possible, and he agreed with Dr Marriott as to the large amount of fluid and salts which could be retained by the rectum Mr LAWRENCE ABEL described an apparatus known as the Baxter vacolitre which he had found very useful

SULPHANILAMIDE AND ITS CONGENERS

At a joint discussion of the Sections of Medicine and of Therapeutics of the Royal Society of Medicine, with Dr H LETHEBY TIDY in the chair, a discussion took place on the treatment of bacterial diseases with sulphanilamide and related substances

Dr LEONARD COLEBROOK said that recent work had shown that sulphanilamide (and some modifications of it) was as good as prontosil in experimental infections that it had definite anti-bacterial properties while prontosil had not, also that these properties were quite different from those of most "antiseptic" substances, that prontosil was partly converted into sulphanilamide in the body, and that the blood of patients treated by either prontosil or sulphanilamide acquired a considerable power of killing haemolytic streptococci Sulphanilamide and prontosil were extremely diffusible substances, and of very low toxicity for men and animals Both drugs were capable of controlling infections by haemolytic streptococci in man as well as in experimental animals (almost certainly), and chronicity of the infections did not necessarily interfere with the curative effect

Experience at Queen Charlotte's

Dr Colebrook went on to say that for the five years before prontosil was introduced in puerperal fever cases at Queen Charlotte's the death rate had averaged 22·8 per cent, since the beginning of 1936, when red prontosil was introduced, the death rate had been 5·5 per cent There might, of course, have been some change in the invasiveness of the streptococcus, but if so it happened quite suddenly and coincided with the introduction of prontosil He felt they had almost as much right to certainty in attributing the improved results to the drug as they had for most of their beliefs in medicine So far no favourable results had been seen in infections other than those of haemolytic streptococci Another point was that although the results previously obtained with sulphanilamide had been quite satisfactory, there had been one or two slight cases of parametritis The results with red

ELECTRICITY IN THERAPEUTICS

Electricity in Therapeutics A Technical and Clinical Compendium By Harold H U Cross Ph.D With a preface by Dr Georges Bourguignon (Pp 380 239 figures 25s net.) London Crosby Lockwood and Son Ltd 1936

This book has been written, as the preface states, 'in the hope that it will supply just such technical information as will show the student and the practitioner the underlying electrical and chemical principles of electricity in therapeutics, in order that an intelligent interest may be taken in the selection and use of the various apparatus and treatments now so generally available' That this is a modest understatement of his work is at once apparent to anyone familiar with books on electrotherapy, for Dr Cross's volume is a most detailed treatise on the technical and clinical aspects of electricity in modern therapeutics—so much so that it would be adequate as an introductory handbook for those who think of specializing in the subject With the recent rapid development of electrotherapy and physical methods, special qualifications and specialization are becoming essential, and in a single handed general practice the average practitioner cannot give to electrotherapeutic procedures the close attention they demand Unless he is able to use electrical apparatus much of the present volume will be in excess of requirements even if it is only intended to evoke an intelligent interest in apparatus and treatment On the other hand for those who are actually using apparatus clinically the book will be valuable for its wealth of precise technical detail and its helpful advice about the choice of electrotherapeutic installations and the control and care of them

In the introductory chapters the mechanics of electrology are explained without recourse to mathematical formulae, often an obstacle to enjoyment of the early chapters of books on medical electricity The chapter on the elements of electrodiagnosis is especially interesting for although most practitioners have a more or less vague conception of the reactions obtained by the classical faradic and galvanic system of nerve and muscle testing they do not know the recently developed chronaxy system which is infinitely more delicate and precise and which in the hands of experts will yield the maximum of information Dr Cross describes the technique and rules of this method as elaborated and practised at the Salpêtrière by Dr Georges Bourguignon, under whom he has done much of his work in Paris

It is surprising to find five chapters devoted to the principles and practice of electrolysis and ionic medication for in the majority of modern books it is taken for granted that readers are familiar with the possibilities of these methods and they are consequently described in short space to allow for more detailed treatment of newer techniques. In this book however the chapters on ionization are among the most interesting and important for the author has had much experience of his subject and has made some original experiments He has for instance demonstrated by radiographs the penetration of ions into jelly masses and animal tissues and has calculated the quantities of certain drugs recoverable from the urine following ionization Readers in England will be interested in his account of the new system of trans cerebral ionization in the treatment of hemiplegia, first developed by Bourguignon and practised at the Salpêtrière on almost a mass production scale Good results are claimed (vide page 248), as follows

> In brief it may be said that all cases of hemiplegia can be improved by the transcerebral method but the degree of amelioration varies in individual subjects, and above all with the exact location of the lesion In the best cases the patient recovers such a command of his limbs that he is able to walk normally and to dress himself and feed himself without any assistance In rare cases even the sign of Babinski disappears"

Ultra-violet and infra-red radiation are next considered, but these receive comparatively scant attention, and of the forty pages given to high-frequency currents (including short wave and long wave practice) more than half are descriptive of apparatus Dr Cross describes his book as a technical and clinical compendium, expressly written to meet the needs of general practice As a technical compendium it is excellent, but if it is to interest the general practitioner the clinical aspects and particularly the physiological effects, of the treatments described should have pride of place

A SYSTEM OF SURGICAL PRACTICE

Surgical Treatment A Practical Treatise on the Therapy of Surgical Diseases By James Peter Warbasse M D F A C S., and Calvin Mason Smyth Jun., B.S M.D F A C S Second edition (Three volumes Pp 2 486 2 237 figures £7 7s) Philadelphia and London W B Saunders Co 1937

The second edition of *Surgical Treatment* by J P Warbasse and C M Smyth is a large system of surgical practice in three volumes, the first consisting of some 900 pages, while the second and third number approximately 800 pages each There are nearly 2,500 illustrations scattered through the three volumes A small similarly bound volume of some 130 pages forms a general index, while each of the three chief volumes is separately indexed In a foreword the senior author states that it is assumed that the surgeon who turns to these pages for help is familiar with the fundamentals of surgical pathology and diagnosis prophylaxis is regarded as a part of pretreatment, and prognosis is so intimately associated with the result of treatment that each is accorded as much attention as possible This statement defines fairly well the scope of the work it is essentially concerned with treatment and is a guide to the practice of operative surgery, including gynaecology ophthalmology and ear nose, and throat surgery In certain sections the work has been brought right up to date thus the newer anaesthetic agents such as cyclopropane vinyl ether, and the so-called basal anaesthetics such as avertin and sodium amytal are dealt with in the section on anaesthesia, and the treatment of inguinal hernia by injection is referred to in a discussion on the treatment of hernia

In a comprehensive work such as this it is not easy to select particular detail for comment The pages on the economic and social aspects of surgical treatment make interesting reading this being a subject to which the senior author has contributed several monographs Exception might be taken by some to the statement that Dupuytren's contracture is best treated by operation and that removal of the fascia gives the best result The illustrations—with certain rather outstanding exceptions for example Fig 716—are clear and good and the photographs showing limbless artisans at work are excellent The section on amputations and artificial limbs is perhaps one of the best in the book but the statement that the adductor tubercle is the point of attachment of the adductor

Aspect of Organic Chemistry

Professor ARTHUR GREEN late Director of Research, British Dyestuff Corporation, dealt with the question from the aspect of organic chemistry He had always been impressed by Ehrlich s analogy—rather more than an analogy—of dyestuffs and drugs A substance to be a dyestuff must have two properties it must be coloured and have affinity for the fibre In the same way a drug to be active must have two properties a degree of toxicity and an affinity for cell constituents But the analogy went further, because there were dyestuffs which had a differential effect and in a mixed material of artificial silk and cotton would dye the silk and leave the cotton white, or the reverse In a similar way the ideal remedy would be a compound which had an affinity for the cell constituents of an invading organism but none for those of the host Prontosil was a compound which had a much greater affinity for the cell constituents of the parasite All these substances were derivatives of aniline, which itself had probably a strong affinity for all cell constituents and therefore was extremely toxic If the sulphonic acid group were introduced practically all the toxicity was lost, but the affinity for cell constituents was lost also But by using instead of the strongly acid group a slightly acid group SO_2NH_2 the substance was able to exhibit a differential attraction for microbe and host

RETROVERSION OF THE UTERUS

At a meeting of the Section of Obstetrics of the Royal Academy of Medicine in Ireland on October 15, with Dr BETHEL SOLOMONS in the chair, the president, Dr J S QUIN read an address on backward displacements of the uterus

Dr Quin said that he regarded the supracervical part of the uterus as the only fixed part of that organ—it being firmly held by the parametrial and paravaginal tissues These tissues acted as a pivot about which the uterus might rotate in the vertical axis, with a normal range of movement of almost 120 degrees The normal position of the uterus in anteversion and anteflexion was due to the forward tilt of the pelvis in the erect posture Congenital deviations from the normal in unmarried women rarely caused symptoms After marriage a congenital displacement might be evidenced by, for example, dyspareunia Usually, however, the patient sought advice for sterility or an early abortion In the latter event replacement of the uterus and the insertion of a pessary for three months was advised The uterus might then be found to lie normally, or more commonly to fall back again, in which case the patient should be warned to report at once for further pessary treatment should she become pregnant

In sterility due to congenital retroversion operative treatment was recommended Incarceration of the congenitally retroverted gravid uterus was rare Acquired puerperal displacements of the uterus were noted in about one-fifth of the patients examined after delivery Dr Quin suggested that all patients should be examined from four to six weeks post partum, and treatment with a pessary instituted should a retroversion be found Even if the pessary did not cure the condition it would assist the proper involution of the uterus Symptoms only arose if there was subinvolution of the uterus or if there was some degree of descent of the uterus and vaginal vault The modified Gillian suspension operation was the most satisfactory in these cases

A long and interesting discussion followed, in which Drs T M HEALY J CUNNINGHAM (Master of the National Maternity Hospital) D J CANNON A H DAVIDSON (Master of the Rotunda Hospital), R H J M CORBET O D BROWNE BETHEL SOLOMONS A W SPAIN and N FALKINER took part

SCIENCE AND THE LAW

Sir TRAVERS HUMPHREYS delivered his presidential address to the Medico-Legal Society on October 28 at Manson House, taking as his subject the place of medicine and other sciences in the administration of justice The assistance offered by science to law, he said, should be received with gratitude but used with caution Scientific evidence must not deal with theory, but must tend directly to the proof of the issue Expert evidence, like many other good things, was none the worse for being kept in its proper place For instance, he did not believe that blood alcohol estimations were likely to become compulsory in this country The complete absence of alcohol from a blood sample might be invaluable evidence for the defence, but where a defendant admitted having taken a substantial amount of drink the result would have little evidential value and might be highly prejudicial The important fact was not the amount of alcohol consumed but the effect upon the accused Blood group tests for non-paternity might be important and useful where all parties were anxious to arrive at the truth In legal proceedings, however, where the parties were at arm's length, they did not seem likely in the present state of the law to be of much assistance A dishonest mother or a man with a guilty mind would hardly submit to the test and the court could not legally draw any adverse inference from their refusal Legislation was essential before any extensive use of this valuable discovery was likely to be made in the law courts It seemed not unfair that a woman who refused to afford facilities to the court for ascertaining a fact of such outstanding importance should be put into the same category as a workman who in asking for compensation for injury, refused unreasonably to submit to medical examination

Chemical analysis of the paper and ink of a supposed will, proving that neither had come into existence at the alleged date of execution, would completely destroy a dishonest claim to probate This class of evidence went directly to the root of the issue and had the advantage of appealing to a jury To the mind of the average jury man chemistry could not lie—though presumably a chemist could It was therefore all-important that no expert evidence should be tendered except by an acknowledged authority upon the particular branch of science concerned Jurymen, however, were not fools Twelve very ordinary persons when put into a jury-box were apt to display a collective sagacity and courage very disconcerting to those superior persons who regarded them as easy prey A jury had a good nose for a real expert as distinct from a mere crank, and reposed great faith in those expert witnesses who could speak with authority and whom they had found to be fair

The medical witness should prepare himself to answer any question fairly arising out of the facts, but should not be afraid to say on occasion, "I do not know" He should, whenever possible, introduce some tangible object to help the jury to follow his evidence and judge the matter for themselves In the trial of the Seddons, Dr Willcox and Dr Spilsbury, as they then were, had never used language which the ordinary juryman could not follow Much useful evidence consisted of identification, by means of enlarged photographs, of minute marks produced on surfaces by particular instruments Professor Tryhorn had once conclusively proved that a lead-cased telephone wire had been cut by one portion of the edge of a particular knife The principles of finger print identification had never been disturbed, and bullets and cartridge cases could be precisely matched with the weapons from which they had been fired

Doctors and Criminal Abortion

The president declared that while on circuit he had found it difficult to understand the attitude of many doctors towards the offence of criminal abortion This was usually committed by ignorant women under dirty

on other hearts the same effects as vagal stimulation Since that time investigations have multiplied and controversy raged around the subject of the humoral transmission of nerve action As a result of these activities it has emerged that there are at least two types of chemical mediator, one resembling acetyl choline and one resembling adrenaline No laboratory has been more in the forefront of these investigations, particularly as regards the adrenaline like mediators, than that of Professor Cannon and it is a pleasure to have available in the form of a monograph an account of the most important investigations in the whole field, and written by workers who have themselves made history in this branch of research

Probably most authorities in this country will not be prepared to follow the authors in their postulation of two kinds of sympathin, the so-called E and I, but criticisms of their views are dealt with, and it would seem wise to suspend judgement on the matter pending further work The harmonization of the theories based on the electrical phenomena with those derived from the facts of humoral mediation is yet incomplete, and will no doubt for some time to come give rise to further controversy But in a monograph such as the present one, which represents an actively growing point, there must necessarily be much remaining to be cleared up

The monograph will prove most valuable to those wishing for an authoritative and up to date account of a subject that is largely occupying the attention of physiologists at present That the outcome will be of great importance to medical science, as to general biological concepts, cannot be doubted The references are most valuable, and as complete as need be

Notes on Books

The second volume of the forty seventh series of *International Clinics* edited by Dr LOUIS HAMMAN (J B Lippincott Co, four vols yearly, 50s) is divided into six sections devoted respectively to infectious diseases abdominal diseases, diseases of the blood diagnosis, treatment and *recent progress in obstetrics and gynaecology* The first section contains, among others papers by Dr F Janney Smith on the coexistence of syphilis of the aorta and bacterial endocarditis clinical manifestations of *Streptococcus viridans* infection by Dr H Comonfort Denman, and actinomycotic infection of the central nervous system by Drs E D Friedman and Harold H Levy In the other section attention may be drawn to the instructive articles on the clinical significance of abdominal pain by Drs Julius Friedenwald and Samuel Morrison the diagnosis of suspected carcinoma of the stomach by Dr R R Snowden and the management of asymptomatic heart disease, by Dr C Sidney Burwell

A third edition of the English version of the *Pocket Atlas of Anatomy* by VICTOR PAUCHET and S DUPRET has been issued by Humphrey Milford of the Oxford University Press (price 12s 6d) in association with the American and Melbourne Universities Presses It consists of 345 plates in which the main facts of human anatomy are graphically represented the names being clearly printed in full at the sides The nomenclature adopted is that approved by the Anatomical Society of Great Britain and Ireland in 1933 with some terms of the Basle Nomina Anatomica appended in brackets Much skill and ingenuity has been shown in adapting and simplifying certain drawings from well known anatomical works and accentuating particular parts or systems such as the lymphatic or arterial to the exclusion of others The work is remarkably free from errors and will certainly prove to be a handy and popular book of reference, which will be useful to both students and practitioners

Famous American Men of Science is a symposium of four short biographies by J G CROWTHER (Secker and Warburg 15s) The book deals with *Benjamin Franklin*, Joseph Henry, Willard Gibbs, and Thomas Edison The author states in his foreword that this volume has been written as a contribution to the study of the role of science in modern life, and he has endeavoured to trace the relationship between the problems investigated by these scientists and the social needs of their times Although the whole book is of interest to the intelligent reader of catholic taste, the pages devoted to Edison naturally have the widest appeal Edison lived to the age of 84, despite the fact that 'he smoked large numbers of strong cigars, chewed tobacco, drank much strong coffee, and took no exercise" His ration of sleep was far below the normal, and he was able to work for twenty hours a day over long periods The lives of these four men exercised a profound influence on social and economic conditions in the United States Those who wish to study them more fully will find a bibliography appended to each section of the book

Operating Room Procedures for Nurses by JEAN D JOLLY (Faber and Faber, 3s 6d), tells the nurse the things she ought to know when detailed for duty in the operating theatre It describes the sterilization of instruments, dressings, and suture materials how to make up the commonly used lotions and the instruments required in different operations This little book should be a valuable help to all nurses whose duties take them into the operating theatre

Preparations and Appliances

TESTING PROTEIN SENSITIVITY

For the convenience of practitioners undertaking tests for protein sensitivity, particularly in the diagnosis treatment and prophylaxis of hay fever, asthma, urticaria and allied diseases Messrs. Allen and Hanburys have produced a compact and easily portable *Cuti Reactions Outfit.* This consists of a steel diamond bladed scarifier together with the necessary agents for testing The proteins considered have been divided into three categories—namely, vegetable foods animal foods and dusts and pollens Protein mixtures which will indicate the primary group of the individual tested have been prepared and set up in three ampoules, and once this primary group is known further detailed testing becomes relatively easy Among the twenty-eight constituents of these three primary groups are proteins from vegetables and fruits, certain fungi and the more important cereals in the first group with the proteins of fish meats milk products and eggs in the second group and pollen air borne dust cat dog and horse hairs and feathers in the third group With the outfit is a booklet giving adequate directions as to the way in which it may be used and there are also charts on which may be indicated the results of the primary tests and of the later group tests There are also four ampoules of a solution for control purposes Further details may be obtained from the makers Allen and Hanburys Ltd., Bethnal Green, London E.2

A GONADOTROPIC HORMONE

Serogan (British Drug Houses Ltd) is a gonadotropic hormone obtained from the serum of pregnant mares The predominant action of the preparation is the stimulation of follicular ripening. Serogan is introduced chiefly for the treatment of disorders arising from deficient secretion of the ovarian follicular hormone (oestrin) The preparation is supplied in powder in ampoules and must be dissolved immediately before administration which is by subcutaneous injection The activity of this hormone is measured by its power to produce follicular ripening in immature mice Each ampoule of the preparation contains 100 mouse units

annual income To raise this sum he suggested that employers throughout the country should give a donation at the rate of one shilling per employee and pay an annual subscription at the rate of one penny per employee The Duke of Kent said that industrialists might think it hard to be asked to bear so much of the burden, but the problem of the mental health of the country was one that primarily affected them as employers of labour

London Voluntary Hospitals in 1936

The statistical review issued annually by King Edward's Hospital Fund[1] shows that the voluntary hospitals of the metropolis received last year £2,619,000 in voluntary gifts alone, besides a further £1,815,000 in the form of payments by patients, either direct or through contributory schemes, in return for services rendered These two items between them account for about seven eighths of the hospitals' total receipts of £5,093,000 Of this large sum £4,196,000 was received on account of current expenses, the rest being given for endowment or for capital expenditure—that is, rebuilding, extensions, modernization, or the purchase of new and expensive apparatus In return for this support the hospitals have increased their work both by actual extensions—the total number of beds being now 18 160—and by providing new methods of treatment Increases have also been recorded in the number of in-patients, who are some 6,000 up at 280,000, and of out-patient attendances, which have risen by 2 per cent to a total of 10,000,000 The result of all this has been that the hospitals have, in the aggregate, very slightly overspent their income Individually eighty-six of them had surpluses, while fifty-nine of them had deficits Had it not been for a drop in legacies, a source of income which varies from year to year, income would have covered expenditure despite a general rise in prices An innovation in this edition of the statistical review is the publication of the 1922 figures alongside those for 1932–6 Whereas in 1922 a patient stayed in hospital on an average twenty-three days, in 1936 the average had been reduced to twenty days, or looking at it the other way round, each bed was used for eighteen patients during 1936, but only fifteen in 1922 In the out-patient departments the number of attendances per patient has increased, as well as the actual number of patients Discussing this question the review says

"Attention has been drawn in recent reviews to the changing conception of the proper function of an out patient department in present-day conditions There is an increasing tendency to discourage attendance for trivial complaints which can be adequately treated by other agencies than hospitals and to develop the consultative work of the department while at the same time providing greater facilities for more prolonged treatments not available elsewhere

SCOTLAND

Physical Fitness Campaign in Scotland

Speaking at a meeting of delegates from education authorities in Scotland, held at Peebles, Mr Walter Elliot, Secretary of State for Scotland, said that the Physical Training and Recreation Act should be regarded as providing a means towards the re creation of the Scottish people It was true that according to all records they were a healthier people than ever before with less incidence of disease and with a lengthened span of life Yet in 1936 the death rate in Scotland was over 13 per 1,000, while in England it was over 12 in Switzerland only 11 4, in Norway 10 3 and in the Netherlands 8 7 Why should the people be healthier in these other countries? He would suggest that it was perhaps because there was some thing lacking in the manner of life something lacking in effort to refit themselves physically mentally and spiritually against the preoccupations of life, especially of industrial life Health did not mean simply freedom from disease, it was a proper way of living so as to enjoy the full savour of life Regional committees had now been established in each of the five regions of Scotland, and these would be the bodies to whom applications for grants under the Act should be addressed There was no suggestion of compulsion about this move ment, and it depended entirely on the free choice of each individual, for whom the National Advisory Council would provide guidance and advice They looked to the local authorities and to the voluntary organizations to help in providing the facilities needed in the way of gymnasia, playing fields, swimming baths, and other things The grants from public funds were not meant, however, to replace voluntary effort, and in this connexion he was glad to be able to hand over a cheque for £4 000 by the expressed wish of the King, this sum having been derived from the recent exhibition in Edinburgh of the coronation robes Lord Polwarth, president of the Association of County Councils in Scotland, said that the provision of facilities for recreation was more difficult for the non industrial counties than it was for the cities The counties had less money and their population was sparse, so that it was more difficult to organize voluntary agencies for physical fitness Sir Louis Gumley, Lord Provost of Edinburgh, said that the question of fitness was also one for the local authorities, and they would have no hesitation in doing what they could

Financing the Campaign

On the second day of the conference reference was made to the Government's plans for financing the cam paign Mr J Westwood believed that the greatest responsibility in this health campaign rested upon the education authorities, for a healthy race had to be built up on the boys and girls who were turned out of schools Education authorities could find the mentally and physic ally trained group leaders who were essential for success in this work Further, they had the power to provide holiday camps for all persons within their area, and this was a great opportunity in the interests of health. Councillor A Ritchie, Glasgow, did not think that the £100,000 which the Government proposed to hand over to local authorities in Scotland for the setting up of these services was sufficient, and he instanced a stadium which was to be erected at Glasgow Green and which alone was going to cost £120,000 Mr Walter Elliot stated that the £100,000 represented the reasonable share for Scotland of the money which had already been set aside for this purpose but it was not the final amount It might be enlarged as need for increased money was shown The expenditure of the education authorities was governed by block grants from the central authority, which were increased as expenditure increased, and it was to this source that they must look for the main work of administration The expenditure would rise in the normal development of the policy of the country and would be arranged between central and local authorities

Mr G E Troup, secretary of the Scottish Juvenile Welfare and After-Care Office, said that the use of school premises would be one of the most urgent practical needs of voluntary organizations for young people Physical training instructors would also be needed and more swimming baths with lower charges for admission For great numbers of young people in Scotland opportunities to obtain physical training did not exist They had no desire to organize completely the leisure of youth, but for thousands of young people at the present day leisure was something vague or entirely negative, during which they gravitated to the street corners, not of choice but of necessity Colonel R B Campbell director of physical education at Edinburgh University, said that students were beginning to realize that a certificate of physical attainment was a useful adjunct to a degree when applying for a post A student at a university should balance his education, but until the schools brought the education of

[1] King Edward Hospital Fund, 10 Old Jewry E C.2 (1s net 1s 3d post free)

social adaptation though it is training with a medical background Other things being equal, the man with previous mental deficiency experience will be a better superintendent of a colony than one whose previous experience is limited to a mental hospital, and it is considered surprising that the medical schools have not recognized the opportunities which mental deficiency work offers to men with a taste for institutional service

A list is included in the report of the training courses arranged by various organizations for doctors and others in dealing with mental health work The difficulties at present experienced by medical officers in mental deficiency institutions in obtaining the diploma in psychological medicine are under consideration by some examining bodies The only bodies at present accepting residence in a mental deficiency institution as an alternative to residence in a mental hospital are the University of London, the Conjoint Board of England, and the University of Dublin Other bodies however refer in their regulations to 'approved hospitals' and it is likely that some would 'approve' residence in a mental deficiency colony

Special importance is attached by the Board to mental deficiency courses for medical practitioners The undergraduate medical curriculum is so full that little time is devoted to mental medicine, with the result that many doctors, notably those engaged in the school medical service, sometimes undertake duties which bring them in contact with a wide range of mental defect without any training in the difficult art of assessment Low-grade defect is generally obvious, but the higher grades, which are four or five times as numerous, may present considerable difficulties to anyone, but especially to those who meet them without any previous experience or training The Board urges local authorities to provide opportunities for school medical officers and all other doctors engaged in branches of the public health service which bring them in contact with mental defectives to take advantage of one or other of these courses

Mental Defect and Crime

The subject of crime and mental defect is surveyed in the present report in some detail In 1936 the number of persons found guilty of criminal offences and dealt with as mental defectives was 367, of whom 238 were under the age of twenty one The largest age group for criminal mental defectives is 16–20, adolescence being the period when the high grade defective, if left without protection, is most likely to get into trouble and all the evidence points to the likelihood that the majority of these boys and girls had left school with their defect unrecognized It is added that there is still no explanation why so many defectives are sent to prison without their mental condition having been ascertained—that is to say, why the court did not itself call for medical evidence with regard to the delinquent and decide to take advantage of the power conferred by Section 8 of the Mental Deficiency Act It appears that some courts hold the view that because the offence is a grave one—in more than a quarter of the cases the convictions are for offences of a sexual character—the procedure outlined in that section is not appropriate no matter how mentally subnormal the person may be and that the proper course is to send him to prison and leave to the Secretary of State the question of his removal elsewhere It is observed with concern also that the majority of defectives who have committed criminal offences have not previously been known to the authority

The document under review is Part I of the report Part II is a supplement containing contributions relating to research and other scientific work carried out during the year The number of such communications received last year was seventy seven but it is noted that there are thirteen public mental hospitals from which no contribution of this nature has ever been received and they are asked to consider whether this is due to shortage of staff or absence of laboratory facilities

MEDICAL DEFENCE UNION

A SUCCESSFUL YEAR'S WORK

The annual report of the Medical Defence Union presented at the annual general meeting on October 28 mentions that the membership of the Union has now reached 20,000 The number of cases handled last year was 1,807, slightly in excess of the year before The bulk of the report is taken up with a description of typical cases and a report by the solicitors (Messrs Hempsons)

Many of the cases with which the Union has to deal are the familiar ones in which, on the practitioner rendering his account, some allegation of negligence or inappropriate treatment is for the first time made by the patient obviously as a means of escaping payment Practitioners who have taken the advice of the Union to press for payment and to indicate what steps would be taken in the event of refusal, and to insist also on withdrawal of the allegations, have generally found it effective Some cases arise out of inaccurate reports in newspapers which cast reflections on a practitioner or medical officer Sometimes it is considered unwise to enforce a public apology, which only makes the matter more public but, of course, the procedure in each case must be decided according to the circumstances

Attention is especially drawn in the report to the dangers of urography The Council of the M.D U is somewhat alarmed at the frequency with which complications of an inflammatory nature arise after a patient has had an intravenous injection of a dye to gauge renal efficiency and the patency of the ureters It is considered that practitioners should warn their patients of these risks even when the accepted technique is strictly followed An unfortunate result does not constitute 'negligence' so long as the operating practitioner exercises reasonable care and skill

The solicitors mention that during the year claims were made upon members of the Union in two cases for having performed the wrong operation In one case two boys were admitted to hospital for the operation of circumcision and by mistake were included in the list of cases for tonsillectomy The tonsils in both cases happened to be diseased In the event the matter was disposed of for a nominal sum In the other case it was intended to perform the open operation for correction of a fracture of the tibia, but the nurse prepared the wrong leg The mistake was recognized directly after the incision had been made An action was threatened against the surgeon in this case but when the Union intimated that any claim would be defended it was not pursued Three claims during the year arose out of mishaps associated with the administration of anaesthetics In two of them the accident was due to the Shipway apparatus being wrongly connected, and in the third to a haphazard method of preparing a local anaesthetic with the result that the patient received a serious overdose of adrenaline, and death ensued In this case it was felt desirable to satisfy the claim of the dependants

A comment is made by the solicitors on the relative infrequency of cases of libel and slander as compared with former years Of 121 cases of all kinds referred to them during the year only ten had to do with libel or slander whereas some years ago the proportion was 25 per cent It is mentioned that there still appear to be members of the profession who are not acquainted with the terms of the Dentists Act 1921, for twice during the past year the solicitors have been consulted by members of the Union who have been accused justifiably of slander by telling patients that their dentist, though registered was not qualified and that if they administered an anaesthetic for him they would be guilty of "covering" In both these cases the matter was disposed of with an apology but medical practitioners should know that there is nothing which precludes them from according professional recognition and assistance to any dental practitioner upon the *Register*

when the hospital became just a little more medically understaffed, when the nursing staff cried out for shorter hours and adequate payment, and when the specialist found that he could not give to the hospitals the gratuitous service which the voluntary system demanded Dr Boyd's suggestions towards a solution of this problem—unless State control was accepted—included extending the national health insurance scheme to the dependants of wage earners and enabling the so called middle classes to avoid hospitalization by a system of insurance to cover the cost of treatment in a nursing home Earlier in his address Dr Boyd had said that when the time came that the size of the individual practitioner's insured list was limited to the number of patients that could be treated with a high standard of clinical skill, then the insured person would receive benefits which frequently existed now only in theory This would mean a grading of the *maximum size of each practitioner's list to a figure* calculated on the sickness index in the district and local conditions, and a corresponding graded increase in the already too small capitation fee

The Late Sir J W Moore

Dr J R A Todhunter writes from Birmingham In the obituary notice of Sir John William Moore in the *Journal* of October 23 mention is made of the fact that he was one of the group of four on whom the Diploma in State Medicine was first conferred by Dublin University It may perhaps be of interest to Dublin graduates to recall the names of the other three men of this group, they were Arthur Wynne Foot, Gerald Yo, and my father, John Todhunter Of the Dublin cholera epidemic of 1866 I can recollect my father telling, there were no trained nurses in the Meath Hospital in those days, only old women of the Sairey Gamp type, some of whom, however, were quite shrewd diagnosticians, and would call attention to a suspect cholera case by saying, "Ah! sure, I think he's got the twistin' o' the guts" I had the pleasure of meeting Sir John Moore fifteen years ago, when he told me that he had received his first instruction in clinical medicine from my father, who was at the time house-physician to the great William Stokes, whom Moore himself was later to succeed as physician to the Meath Hospital I am sure that no one who met Sir John Moore could fail to be impressed by his innate courtesy and kindliness, and by his geniality, a quality that was conspicuous in the few others of his Dublin contemporaries whom it was my privilege to have met occasionally in years past In him has passed away the last survivor of a generation that linked us with the great Dublin physicians of a century ago

Irish Free State Medical Research Council

The Medical Research Council of the Irish Free State has made five grants for whole-time research as follows Dr D K O'Donovan to continue his investigations into the part played by the liver and adrenals in the response to the introduction into the body of the metabolic stimulant of the pituitary gland, Dr E F McCarthy, an investigation into the osmotic pressure of human serum protein and the oxygen capacity of haemoglobin, Dr Barbara Moran, research into *C diphtheriae* and streptococci, Dr Cecil Mushatt, research into the types of tubercle bacilli occurring in Ireland, and Mr R P Cooke, research on blood ammonia Dr McCarthy will work at the Rockefeller Institute, New York, Dr O Donovan at McGill University Montreal, and the others in Dublin Grants for part-time research have been made to Dr Edward Keenan and Dr W R O Farrell (bundle branch block) and Dr T C J O Connell (effects of tuberculosis on the kidney) Four grants for one year's training in methods of research have been made to Drs Eamonn de Valera Oliver FitzGerald Patrick FitzGerald, and Owen T D Loughnan The members of the Research Council are Professors R P Farnan (chairman) J W Bigger, J M O Connor, John McGrath J F Donegan W J E Jessop Henry F Moore, T G Moorhead, and J M O Donovan

Parkinsonism following Peripheral Trauma

SIR,—The cases recently reported (G F Walker and J C Hodgson, *British Medical Journal* July 10 and September 18, 1937) raise questions of vast medico legal importance Does the evidence at present justify acceptance of the view that a peripheral injury may of itself cause Parkinsonism? The whole question is rendered difficult by the well-known fact that an attack of encephalitis lethargica, which everyone agrees to be the most frequent cause of Parkinsonism in persons under the age of 40, not infrequently occurs in patients whose primary illness was too slight to be noticed It would seem, therefore, to be necessary before accepting injury as a cause of Parkinsonism to exclude the possibility of an "occult" infection by encephalitis lethargica

It would seem probable that the man whose case was reported by Dr Hodgson lived in the Ashford district, where authenticated cases of encephalitis lethargica occurred during the years 1921–4, which at once introduces a doubt of this case being one in support of any contention that Parkinsonism may supervene on a peripheral injury

It is perhaps worth adding that there is no evidence in the Ministry's possession to show that the incidence of Parkinsonism amongst wounded men—of whom there were not less than half a million—is any greater than that amongst the civilian population—I am, etc,

Treatment of Fractures of the Neck of the Femur

SIR,—In the Section of Surgery at the Annual Meeting of the B M A at Oxford in 1936 I opened the discussion on the treatment of fracture of the neck of the femur with the statement that the abduction method, utilizing anatomical mechanics for the reduction of deformity and fixation of the fragments, had established surgical principles as the rule of practice The chief subject for discussion at this meeting was spiking the neck of the femur for transcervical fractures, with the aim of assisting repair by secure fixation of the fragments, also to dispense with splinting and to permit movement and even locomotion within a few days or weeks of treatment

It may be noted that the advocates of spiking preface their expositions with an account of discomforts, dangers, and failures of the abduction treatment, from which one may conclude that their training and experience have not been of the quality which they would consider essential for the spiking procedure The strongest argument against the abduction treatment has been the period of disability that it involves, and it is from this standpoint that I wish to call attention to a paper by Dr Kleinberg in the October issue of the *Journal of Bone and Joint Surgery* on early weight bearing as an adjunct of the abduction treatment As Dr Kleinberg was for many years associated with me in my hospital work I can vouch for the reliability of his observations

He reports on the results of twenty-four cases of fracture of the neck of the femur, twelve of these were transcervical and twelve were intertrochanteric In two

character of the lesion Metastases in the brain from tumours such as melanoma and carcinoma of the breast have long been taken into account, but *it is only comparatively recently that the frequent* occurrence in the brain of secondary deposits from carcinoma of the lung has been recognized There is little doubt that there is a true increase in the incidence of bronchial carcinoma—the greater number of cases cannot be accounted for merely by improved methods of investigation—and in view of the fact that the dissemination of these tumours may frequently involve the brain, it is *clear that special attention must be paid to the* examination of the chest in all cases of intracranial tumour As Dr Walshe points out, metastatic carcinoma in the brain should be suspected when the neurological signs suggest multiple brain lesions, when there is evidence of meningeal involvement which simulates an infective meningitis, and when there is progressive loss of weight—a feature rarely observed when the intracranial tumour is primary

SEX HORMONE THERAPY

The use of standardized preparations of the sex hormones and of biologically assayed preparations of gonadotropic hormones in the treatment of disorders of menstruation and of pregnancy is of recent origin At first high hopes of success were entertained but experience revealed the difficulties underlying this form of treatment and the problem may now be reviewed critically Dosage has been largely empirical owing to the difficulty in devising objective signs of effectiveness It was soon recognized that calculations based on the amount of hormone necessary to induce changes in castrated or hypophysectomized animals could not be applied to the human female A ratio based on the factor of body weight does not hold good There are now available however four objective signs the transformation of a menopausal to an oestrous type of smear the increase in size of a hypoplastic uterus the production of proliferation or of a secretory phase in a sample of endometrium obtained by curettage and the production of oestrin withdrawal bleeding from the uterus Experience gained by the use of these objective signs has shown that the doses of oestrin required to render them positive differ considerably Relatively small doses for instance give rise to changes in the vaginal mucosa as compared with the amount of oestrin necessary to induce oestrin withdrawal bleeding from the uterus It will therefore never be possible to speak of a woman unit of oestrin and it will be necessary to specify the test object in some such terms as oestrous smear unit or oestrin withdrawal bleeding unit Furthermore the dose of oestrin required to elicit one of the objective signs varies from woman to woman In one woman suffering from amenorrhoea oestrin withdrawal bleeding may be produced only when very large total doses such as 1¼ million units (0 125 gramme) are given, whereas another patient may bleed after a total dose of only 50,000 units It is obvious, therefore, that so far as woman is concerned each component of the reproductive tract responds to a different dose of oestrin and that these responses vary from woman to woman, and that in each individual woman they vary from time to time *Women of menopausal age, for instance, respond* to comparatively low doses of oestrin, which accounts for such extremely satisfactory results of oestrin therapy in the menopausal syndrome as are reported by Dr H R Donald at page 899 of the present issue, whereas oestrin has little effect on the normal non pregnant woman, and no effect at all during normal pregnancy These observations indicate the importance of the factor of sensitivity of the organ For example, the phenomenon of regression of the sexual skin swelling in monkeys immediately after rupture of the follicle, which has been employed as an objective sign of ovulation in this animal, is due to the appearance of the corpus luteum with the secretion of progesterone, which renders the reproductive tract less sensitive to the influence of oestrin Thus, *in considering* the effect of oestrin on the reproductive tract one has to pay attention not only to the amount of *oestrin reaching it in the circulation* but also to the extent to which it is capable of utilizing that oestrin

The route by which the hormone is administered is also important The only hormone of this group which has as yet been shown to be effective by mouth is oestrin Some oestrogenic compounds are more effective orally than others Oestrone, for instance is a more effective compound than oestriol but oestriol is more easily absorbed than oestrone Attention should also be given to the duration of effect which depends on the chemical composition of the compound The esters of oestrin and of testosterone prolong their effect considerably the influence of the benzoate of oestradiol lasts for at least three or four days and that of testosterone propionate for a week or ten days whereas the palmitate of oestradiol is said to be effective for three months and the subcutaneous implantation of crystals of oestrin or male hormone has been shown to render the material active for a still longer period Professor Korenchevsky in his paper in the present issue of the *Journal*, refers to the principle of co-operative activity Oestrone progesterone and some of the male hormone compounds, when given together in

The report on "The Sister Kenny Clinic" has just been made available in New South Wales, and the orthopaedic surgeons who examined the patients say that the results in the treatment of spastic and flaccid paralysis were not superior to those of the accepted methods Sister Kenny introduced nothing new I have seen a film illustrating her results In it were shown patients cured by Sister Kenny's method, but who had still paralysed quadriceps and dropped feet, and the spastic cases that I saw were still spastic after treatment and were certainly in no respect cured In dealing with the treatment Dr Mills says that the patient is told to relax This is the problem of the spastic paralytic, and will not be solved by Sister Kenny's methods with exercises and hot water—I am, etc,

Sydney, Oct 15 N D ROYLE

Idiosyncrasy to Prontosil

SIR,—I was much interested in Dr Hugh Woods's letter in the *Journal* of October 23 (p 828) on the rise in temperature seen at times after the administration of prontosil He attributes this rise to the destruction of large numbers of organisms I am much inclined to agree with this view, and would instance a similar condition which I have observed after using the chloro iodine method of treating some chest conditions

It was advocated by Dr J F Halls-Dally for pulmonary tuberculosis, and consists in the administration of large doses of potassium iodide (20 grains) in the morning, followed later in the day by several doses of chlorine solution The principle is that nascent iodine is liberated in the tissues, and combines with any Gram positive organisms, destroying them I have had many cases in which this treatment has been of great benefit, and quite a number in which I observed the phenomenon mentioned above After the first day or two of treatment the temperature showed a marked rise and then fell to a subnormal level and remained low Examination of the sputum showed a marked decrease in the number of bacilli—often there were none to be seen I have always attributed this initial rise of temperature to the destruction of large numbers of organisms, and have likened it to the reaction often seen after the administration of a vaccine—I am, etc,

Wolverhampton, Oct 26 E HAYLING-COLEMAN

Sulphanilamide in Gonococcal Infections

SIR,—Mr Morton Whitby's reply (October 23) clears up one of my problems I had found it difficult to see how one could proclaim cure of gonorrhoea in the fourth to the eighth week, if, however, tests are to continue for six to twelve months—that is another matter He does not use provocative injections (intradermal or subcutaneous) The importance of such methods is debatable, but their use is widespread Whether the cultural and microscopical examination of secretions is sufficient, or whether serological tests should also be considered, is another unsettled question

I have occasionally used the method to which he refers in attempting to convey instillations into the posterior urethra when the meatus would not admit the acorn-tipped tube which we use here but I have been doubtful as to how much of the solution actually did pass backwards That was the difficulty I felt and still have concerning the conveyance of solutions from the urethra to the bladder by massage Clinical findings certainly suggest that trigonitis is not infrequently associated with acute posterior urethritis, though I am not aware of any pathological findings on that point Whether the best method of treating this is by attempts to apply a relatively concentrated solution of antiseptic by massage from the urethra is another matter, indeed, it opens up the much wider questions whether attempts to eradicate gonorrhoea by antiseptics are feasible, and if so, whether mercurochrome is to be recommended It will be remembered that Colebrook and Hare[1] reported adversely on its efficacy as an antiseptic

As to the frequency of gonococcal pyelitis, most authorities (for example, Lees, Harrison,[2] Pelouze,[4] Livermore and Schumann[5]) agree that it is rare, and the suggestion that "frequent bladder irrigations precipitate the ascent of the infection" seems controverted by the fact that the large-scale use of such treatment in public clinics seems to have produced very few records of the condition—I am, etc,

Salford, Oct 23 R C WEBSTER M.D

Prescribing Prontosil

SIR,—When prescribing prontosil it is advisable to inquire into the patient's consumption of garlic or onions Both these contain allyl sulphide $(C_3H_5)_2S$, and if eaten in any quantity may result in the ingestion of an appreciable amount of sulphur—sufficient to blacken a silver wrist-watch where it is in contact with the skin in a few hours Eggs are another possible source of sulphur—I am, etc,

H M STANLEY TURNER.

The Sex Ratio

SIR,—In the *Journal* of October 2 Surgeon Rear Admiral Beadnell asked for an explanation of the sudden drop in the male to female ratio in the estimated population of England and Wales in 1935 about the age group 35–39 and the gradual rise in the ratio at subsequent ages up to about 60 The explanation of this hollow in the sex-ratio curve is that the population aged 35–39 at the end of 1935 was born in 1896–1900 and during 1916–18 was exposed to a greater male mortality in the war than any other age group, being then between the ages of 17 and 22 In consequence of the removal of a large number of males from this group a sudden drop in the male to female ratio was seen at ages 20–24 at the 1921 Census, at 25–29 in the estimated population for 1926, at 30–34 at the 1931 Census, and at 35–39 in the estimated population for 1935 The succeeding age groups also suffered a depletion of males in the war to a diminishing degree, this being responsible in the main for the depression extending over some twenty years of age, which appears in the upper curve of Surgeon Rear-Admiral Beadnell's diagram

Dr Mahony-Jones asks in your issue of October 23, "How, except in Census years, does the Registrar-General know the numbers of English people of different ages at any one time? The estimated total population at each age is built up from the numbers enumerated at the various ages at the last Census, by deducting the deaths registered at each age since the Census, adding the registered births since the Census, and making further corrections for the balance of inward or outward migration in each year The absence from the country of males in

respond to it Susceptibility to this treatment is not a property of certain diseases in the anatomical sense, such as otitis arthritis and peritonitis it is dependent on the identity of the micro organism causing them and an exact bacteriological diagnosis is necessary to intelligent therapy The bacteria which have so far been shown to be susceptible to sulphanilamide are *Streptococcus pyogenes* certain members of the coli-typhoid group the meningococcus, and the gonococcus The possibility of controlling pneumococcal and staphylococcal infections either with sulphanilamide or with other related compounds which are now being studied is still in doubt and other bacteria so far as is known are insusceptible The microbic rather than the regional diagnosis is thus the factor governing success or failure and no observations which neglect this will add usefully to our knowledge of this remarkable remedy

A PSYCHIATRIC CLINIC AT GUY'S

Guy s Hospital has received a gift of £43 000 from ' Five Friends " to build and equip a psychiatric clinic of 42 beds Thus with the six beds already assigned to the Department of Psychological Medicine in the general wards accommodation will be provided for the first time in this country in a general teaching hospital for practically the entire clinical range of functional nervous and mental illness of recent or recoverable type The clinic will contain divisions for-major as well as for minor mental disorders for psychotic as well as for psychoneurotic conditions In addition to the sectional accommodation there will be a laboratory an occupations room a reading room dining room lounge gymnasium games room roof garden and solarium In the division for more acute illness there will be provision for special forms of treatment including continuous baths It is intended to have a full time clinical staff of four doctors whose duties will combine both treatment and research They and the laboratory staff will have access to the laboratories of other departments of the hospital and medical school in which a large new pathology block is in course of construction It is intended that the clinical and research staff shall engage in treatment teaching and instruction in the clinic and in the rest of the hospital One of the most important functions of such a clinic is to bring psychological medicine into closer relationship with general medicine The other advantages of such a clinic in a general hospital are sufficiently obvious The principle has been tried and proved for many years in university centres on the Continent and in America Patients are likely to come for treatment earlier and more willingly to a clinic which is a department of a general hospital Investigation and treatment of mental illness is greatly facilitated while the rest of the hospital benefits reciprocally From the educational aspect the student has the advantage of immediate access to a type of experience which he otherwise has only a limited chance of obtaining—both by taking part as a clinical clerk in the individual care of the patients and by the ready access to lectures and demonstrations given in the clinic and in the hospital by the clinic staff While the clinic will be under the general direction of the physician for psychological medicine to the hospital it will be available for the treatment of patients under the care of any doctor of consultant standing in psychological medicine in co operation with the full time staff The special beds in the general wards will continue to be available for the poorest patients but it will be necessary at first, pending the accumulation of funds for endowment to make a charge for clinic patients ranging from three and a half guineas a week upwards Building is to be begun shortly and the clinic should be open for patients early in 1939

OIL-ASPIRATION PNEUMONIA

For some time past workers in the United States have drawn attention to a form of oil aspiration pneumonia, and it is suggested that this condition frequently fatal is on the increase as a result of the modern advocacy of oily nasal drops for various forms of rhinitis Recently Ikeda[1] has recorded a series of five cases of this condition in adults and points out that in a series of 20 000 post mortem examinations recorded over a period of twenty years before 1932 not a single example of oil-aspiration pneumonia was included but since that time he has discovered seven cases in infants and a further five in adults In the latter liquid paraffin appears to be the chief aetiological agent and the condition occurs predominantly among older persons who because of a chronic infection of the upper respiratory tract, have been spraying or instilling oil into the air passages in large quantities for a long time The typical pulmonary lesion is described as "a chronic non specific non suppurative granulomatous foreign body reaction leading to ultimate tumefaction and fibrosis, in its clinical behaviour and roentgenographic appearance it simulates a neoplastic growth in the lung it has been mistaken for a tumour at necropsy it is essentially a paraffinoma of the lung" Fetterman[2] has also recently described two similar cases in adults but in these the oil was administered by the mouth either as liquid paraffin for laxative purposes or in one instance as halibut liver oil It is noteworthy that both these patients were mentally confused and had difficulty in swallowing and in many of the recorded instances of oil aspiration pneumonia in infants there is also the suggestion of mental defect or of such severe wasting and weakness that the swallowing reflex may be presumed to have been inefficient In other words despite the obvious danger of the indiscriminate use of oily nasal preparations it is doubtful whether the patient who is mentally normal and possesses the normal reflex protective mechanisms of the pharynx is likely to run much risk However the Department of Health for the City of New York has considered the matter serious enough to issue a memorandum for the information of its medical and nursing personnel in which it points out the danger of lipoid pneumonia (as it is called in the U.S.A.) particularly for children under 2 years of age Not only oily nasal drops are condemned but cod-

[2] *J. Lab. & Clin. Med.* 1937 22 619

did with considerable trepidation The child was asphyxiated at birth and the liquor was full of meconium, but he came round with suitable treatment The patient herself had three days of fever, maximum 101° to 102° F, and subsequently made a good recovery This case chiefly led me to abandon the use of spinal anaesthesia for Caesarean section

It is worth noting that the spinal injection is often unusually difficult, because flexion of the spine is limited by the presence of the foetus On one occasion I failed to get into the spinal canal In my cases I used Pitkin's technique, and there was invariably a considerable fall in blood pressure after the injection—I am, etc,

Leeds, Oct. 30 ANDREW M CLAYE

SIR—Mr Henry A Kidd (October 30, p 879) questions the statement that we have never yet found a fall in blood pressure during spinal anaesthesia, and also asks for further details of our technique

We have used spinocain in some hundreds of cases of spinal anaesthesia After taking the blood pressure in 150 cases and never having experienced a drop of more than 5 mm ten minutes after the injection had taken place, we abandoned this seemingly unnecessary practice The cases for Caesarean section did not differ in that respect from the other obstetric and gynaecological cases they caused us no anxiety whatever We think this is in a great measure due to the following technique

1 *Premedication*—(*a*) The night before operation ensure sleep by giving 3 grains of luminal at 9 30 p m

(*b*) One and a half hours before operation 3 grains of nembutal are administered per os The ears are plugged with cotton wool well soaked in olive oil and the eyes well padded with cotton-wool and bandaged We consider this most important

(*c*) Three-quarters of an hour before the operation 1/2 c cm of omnopon scopolamine (Roche) is given intramuscularly If the patient is not asleep or if she rouses at the insertion of the hypodermic needle a further 1½ grains of nembutal is given

(*d*) A quarter of an hour before operation a second 1/2 c cm of omnopon scopolamine (Roche) is given intramuscularly (In the possible interests of the infant we have lately omitted this in Caesarean section)

2 *Administration of the Anaesthetic*—(*a*) I use a non-alkaline 10-c cm glass syringe boiled in distilled water and then rinsed in slightly acidulated boiled distilled water

(*b*) The spinocain capsule is placed in slightly acidulated distilled water at a temperature of 105° to 108° F (The slightest trace of alkalinity will result in poor or even complete absence of anaesthesia)

(*c*) I use a fine Barker's needle for insertion of spinocain preferably between the third and fourth lumbar vertebrae with the patient in the sitting posture under rigid aseptic precautions (cap gloves and mask, and painting the skin with iodine tincture)

(*d*) After loading my syringe with 3 c cm spinocain I withdraw 3 c cm of cerebrospinal fluid and mix this, getting 6 c cm *barbotage* which I inject quickly

(*e*) The patient is then placed in the prone position for eight minutes with the table at 10 degrees tilt

By rigidly following this technique I have never had a failure in Caesarean section operation I think our fortunate results are due first, to the premedication, which places the patient in the best psychological state, and, secondly, to the use of spinocain, which, containing gliadine, enables the anaesthetic to become fixed slowly These two factors are in my opinion, the cause of the negligible drop in blood pressure—I am, etc,

Broadstone Dorset Oct 29 M R C S, L R C P

Brown Bread versus White

SIR—My friend Dr Stallybrass (October 30, p 878) asks that someone in authority should state "how brown bread can be prepared in such a way that the vitamins are not removed" It is to be hoped that this will be done its need has been admirably brought before the public by Sir Robert McCarrison in his Cantor Lectures Meanwhile, mention of rough-and-ready methods we have used here for some years past may be of interest.

1 *Fertility bread* A lady with one little girl miscarried in her second pregnancy and a rather prolonged sterile interval followed Anxious for a male baby she sought advice That which I gave was of the commonplace type—and of course without reference to the sex of a possible child—but, having read of Vogt-Möller's success with wheat germ oil in the treatment of two women who had each had four or five miscarriages I asked Miss Harriette Chick if there were any further data None, she wrote but why use the oil why not the germ itself? She mentioned a proprietary bread rich in it. The germ in that bread, I knew, is treated with superheated steam to make it keep, and Levine of the Rockefeller Institute had told me that the B complex (or one part of it) will not stand great heat Guessing that neither would E (but without knowledge on the point), and that anyhow B and E probably work together I preferred the raw germ A great firm of millers were extraordinarily kind and went out of their way to provide it. (They do still) We received it twenty four hours or less after the rollers had stripped it from the grain One part of this was mixed with two of whole meal and with yeast, and a rather close but sweet-tasting bread resulted Well the baby arrived in due course (by luck a boy) and when after a further prolonged sterile interval, the bread was resumed, in some fifteen to twenty weeks pregnancy was again reported

After this suggestive experience it was natural when attending a woman (Wassermann negative) in her third consecutive miscarriage, to think of the bread In this case it could not be made at home, as it was in the first, so I asked who her baker was He was an expert whom I knew well The same great firm of millers agreed at my request to supply the germ to him several times a week and the difficulty of getting absolutely fresh whole meal to blend with it was met by the baker's man on each baking morning, grinding good English wheat in a large old fashioned coffee mill they had in the shop From the first the bread, though the loaf seemed heavy in the hand, was nutty and pleasant to eat and now, after experience has been gained in the niceties of its baking it has become popular throughout a wide district On account of the oil in the germ (which incidentally justified its soubriquet of fertility bread") it still makes admirable toast when a fortnight old (Some sort of blue Penicillium may grow on its surface if it has been kept in a damp place but it does not penetrate and when it has been scraped off the bread is none the worse)

2 *Wheaten cakes* Our village flour mill no longer grinds for man—only animals A large demand would have to be ensured to justify the heavy imposts the Government require But to some of my former patients I suggested they should grind wheat of their own growing in the mills they use for cattle food and these patients now grind and bake in the traditional way, and an excellent whole-meal bread results. The essential condition is that the baking shall at once follow the grinding But few households have the facilities how then to get fresh whole meal? After many trials we found, in my own ménage that a large coffee mill answers well Small hand grist mills are also to be obtained, the best being those used by millers themselves for grinding samples. As large-scale baking is not always popular the smaller business of making "cakes is practised in many households hereabouts Biscuits" would better suggest the appearance and texture of these cakes but of course they are *not* twice cooked Wheaten cakes are so likeable— I chuckle when I

ANAESTHESIA IN GENERAL PRACTICE

This is one of a series of articles, contributed by invitation

APPARATUS AND EQUIPMENT

BY

J. K. HASLER, M.B., B.S.

The amount of anaesthetic apparatus required in general practice depends very largely on the practitioner himself and the type of practice in which he works. In a country practice, where major operations are infrequent and anaesthetics must often be given under difficult conditions, it would require an exceptionally keen man to carry round a McKesson apparatus with a closed circuit for carbon dioxide absorption. On the other hand a practitioner who works in a town with a well-equipped hospital near by, where he may have to give anaesthetics for every type of operation, will hardly be satisfied with open ether as a routine. Every practitioner must have some ideas of his own on the subject according to first the methods taught at his medical school and secondly, the opportunities and inclination for keeping himself up to date while engaged in practice. It is therefore difficult to lay down hard-and-fast rules as to how much apparatus is necessary and what types are best, and I propose simply to discuss on general lines the more important aspects of the subject.

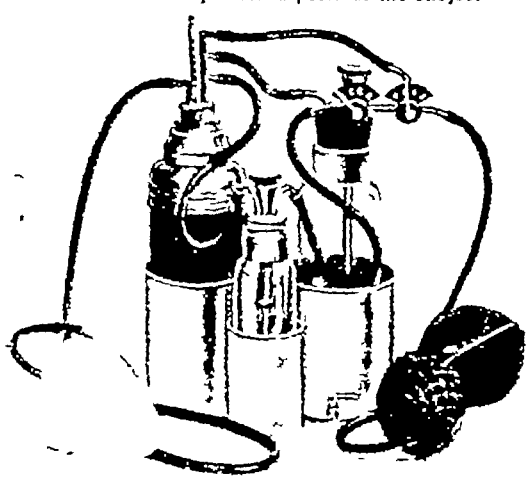

FIG. 1.—Shipway's improved warmed ether and chloroform apparatus.

even the mask may be dispensed with and a piece of lint or the corner of a towel be employed instead. With open anaesthesia the amount of apparatus is reduced to a minimum, and when ether is used the method is nearly foolproof. The Bellamy Gardner pattern of dropper is the one most commonly employed for administering ether, and most chloroform bottles have an outlet in the stopper through which the liquid can be delivered. A simple dropper can be improvised by inserting a small wick of gauze between the neck of the anaesthetic bottle and the cork or stopper. This allows the liquid to drip out when the bottle is tilted. A chloroform drop bottle is convenient for giving open ether to children.

Where operations are to be performed on the mouth or nose it is impossible to maintain anaesthesia by means

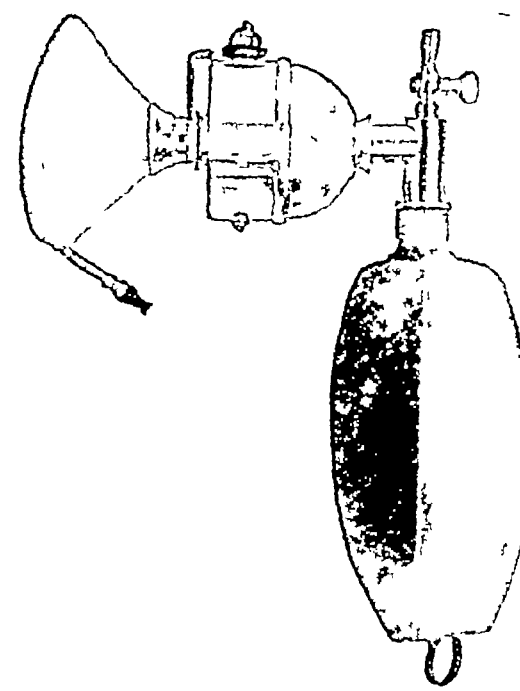

FIG. 2.—Clover's ether apparatus.

a return to a normal appearance of the lungs, was in all cases checked by *x*-ray examination

For details of dosage, etc, Schliephake's book, which has recently been translated into English, should be consulted, but only apparatus of high power is suited for the treatment of these deep seated lesions, as it is essential to keep the glass-covered electrodes at a distance of 10 to 20 cm from the patient's body, wave-lengths of from 6 to 8 metres appeared most efficacious, the patient should only have a very slight sensation of warmth The duration of the treatment is for five to ten minutes on the first and second days, quickly rising to twenty to thirty minutes once or even twice daily Subjective improvement, with the return of sleep and reduction of cough and of weakness, is usually evident after the first one or two treatments, then the sputum loses its offensive smell in the gangrenous cases and lessens in amount, and within eight to ten days there is usually marked objective improvement in the physical signs and the *x*-ray appearances In those cases in which the treatment leads at first to an increase in the amount of sputum with a rise of temperature, etc, the treatment should not be discontinued, or at most only for a day or so, as the favourable course as outlined above will nearly always follow the initial exacerbation of symptoms Finally, it must be stressed that with suitable arrangements this treatment does not cause the slightest discomfort or exhaustion to the patient —I am, etc,

Blackpool Oct 27 W UNGER.

Anti-typhoid Inoculation

SIR,—In his interesting article on typhoid fever in the Basque refugee camp (*Journal*, October 16, p 760) Dr R Taylor says "no opinion could be obtained as to the value of vaccine treatment given in the presence of an epidemic" In an account of an epidemic in the area of the British Army of Occupation in the Rhine, recorded in the *Journal* of December 18, 1920, the opinion was expressed that the inoculation of a community in the presence of an epidemic was beneficial in three ways (*a*) direct, (*b*) indirect, and (*c*) remote, and that the inoculation was beneficial both to the individual and to the community Several other similar inoculations were quoted which were attended by similar favourable results —I am, etc,

Indications for Induction of Abortion

SIR,—In reply to Dr Redmond Roche's letter in the *Journal* of October 30 (p 880), why should the expression "doctors, not necessarily consultants" suggest that "the medical problem is not the prime consideration"? I maintain that general practitioners are at least as competent as consultants to judge the *whole* medical problem The medical effects, on the mother, of pregnancy, childbirth, and the strain of bringing up a child under adverse conditions would all be considered, and also the medical effects, on the child, of such an environment If induction of abortion in suitable cases were legalized, how could that place doctors 'above the common law of England"? They would then be acting in accordance with the law instead of contrary to it as at present,

Since Mr Butterworth's first letter (September 25, p 635) I have discussed the case of the tuberculous patient with one of the most eminent consulting physicians in London who is on the staff of the largest and best-known chest hospital and of one of the largest of the teaching hospitals He said that he would not have hesitated to advise the induction of abortion in this case on account of the strain on the mother of looking after the child afterwards Why has there been no reply from one of those who gave their decision on these cases?—I am, etc,

Nottingham, Oct 31 PERCY HARDY

Expulsion of Placenta in Advance of Foetus

SIR —Several letters have appeared recently dealing with the above phenomenon They bring to my mind a case I attended some years ago She was a woman, in the early thirties, who was having her second baby During the pregnancy hydramnios developed, and this, as time went on, became extreme, so that it became necessary to give relief by puncturing the membranes This I did one evening in the nursing home There was a gush of fluid, and after a short time I left the patient, returning in about two hours Some time later since progress was slow, I examined and found the placenta presenting It came away quite easily, and shortly afterwards an anencephalic foetus was delivered There was no undue haemorrhage, and the patient made an uninterrupted recovery

I discovered later that the nurse in charge had somewhat vigorously pressed on the fundus of the uterus The rapid diminution in size of the latter had probably caused detachment of the placenta, which had thereafter slipped down to the region of the internal os The placenta may, of course, have been situated originally at an abnormally low level, but there had been no symptoms of placenta praevia —I am, etc,

Wrexham, Oct 30 D LIVINGSTONE POW F R C S.Ed

Control of Malaria

SIR —Dr John Roth (*Journal*, October 23, p 829) appara letter by Dr W F Cooper, in which he criticizes a letter from me in the *Journal* of June 5 Dr Cooper has apparently misread my letter I did not write on "the use of quinine" I wrote a letter advocating the destruction of adult infected mosquitos in malaria-infested houses as an important method of malaria control, additional to the methods in general use (anti larval) And I pointed out that the incidence of malaria that continues in spite of all prophylactic methods is so great that we are not justified in neglecting any additional methods, such as destruction of adult mosquitos in malaria-infested houses The simplicity *in theory* of prophylaxis against malaria by the use of quinine is only equalled by its difficulty in practice —I am, etc,

Antigua, British West Indies Oct 12 W M MCDONALD

"A Plain X-Ray"

SIR —Dr John Roth (*Journal* October 23, p 829) apparently objects to the use of the prefix "plain" as applied to radiography, but he does not suggest an alternative term With the increasing use of opaque media as a subsequent procedure in the examination of various parts of the body, it has become necessary to use some distinguishing term for the preliminary examination—that is, the examination made before the ingestion or injection of the opaque medium The physician or surgeon filling in the request form, and the radiologist in his report, may use the adjectives "plain" "direct' or, as in America, 'straight', of these, "direct' seems to be perhaps the most desirable Dr Roth's reference to tomography is "plainly' beside the point —I am, etc,

Hull, Oct 28 R HERMON

characteristic odour masked to some extent by the eau de Cologne or lavender water that is often added With this addition some brands are more fragrant than others, though they seem to be equally efficient as anaesthetics It should be remembered that ethyl chloride as well as ether is a highly inflammable liquid

Accessories

Every anaesthetist should carry an airway a simple piece of apparatus which frequently transforms an indifferent anaesthetic into a good one The Phillips airway is as satisfactory as any, and it should be fitted with a medium size rubber tube rather than a large one For

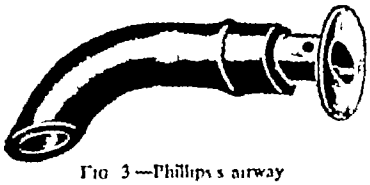

FIG 3—Phillips's airway

hospital work it is an advantage to keep half a dozen on the anaesthetic trolley Each patient can then return to bed after operation with the airway still in position and the anaesthetist can get on with the next case without having to worry whether the last patient is likely to have his respiration obstructed before he reaches the bed A home made airway can easily be contrived by cutting a suitable length off a piece of rubber tubing and inserting a safety pin through one end to prevent it being swallowed It is of advantage to carry a mouth gag in the anaesthetic bag, but opinions differ as to the desirability of using tongue forceps

For endotracheal anaesthesia it is necessary to have some form of laryngoscope, Magill's pattern which contains a dry electric cell in the handle, is a popular choice The Magill endotracheal catheters which are slightly curved are better for general purposes than the straight gum elastic ones as they can be used for blind intubation through the nose without the need for a curved stylet Some lubricant such as liquid paraffin or K Y jelly should be applied to the catheter before it is inserted.

Every anaesthetist should have a supply of drugs at hand though these need not be excessive For purposes of premedication morphine and atropine are still widely used and of recent years nembutal capsules have become popular For nervous subjects particularly children suppositories of nembutal have been recommended Coramine has been found useful in the treatment of those states of emergency which sometimes occur with even the best of anaesthetists It has also been injected at the close of an operation to diminish the action of any barbiturate which the patient may have taken as preliminary medication For quick action it should be given intravenously Where spinal anaesthesia is being used it is advisable to have at hand a supply of ephedrine This too should be injected intravenously if a rapid action is desired An extra cylinder is not necessary in order to have a supply of carbon dioxide available A more convenient method is to carry it in the form of sparklet bulbs which can be fitted into a special metal container like a miniature cylinder and placed in the anaesthetic bag In an emergency a small supply of carbon dioxide can be obtained by turning an ordinary soda water siphon upside down and pressing the trigger Syringes of various sizes are necessary for hypodermic injections spinal anaesthetics, and basal narcotics such as evipan and pentothal sodium It is useful to have a vacuum flask when giving avertin for the solution can then be prepared at home and taken to the patient's house or the nursing home warm and ready for use A sphygmomanometer can be usefully employed for the double purpose of taking the blood pressure and compressing the arm before giving an intravenous injection It is of advantage to have at hand a stomach tube when administering an anaesthetic in a case of intestinal obstruction and some anaesthetists always carry a tracheotomy set for use in an emergency

The foregoing list though necessarily incomplete contains an outline of the more important items which the occasional anaesthetist may find useful in the course of his work In conclusion it is suggested that every anaesthetist should possess a watch with a second hand A serviceable alternative is a theatre clock which has a large second hand or which gives a tick at every half minute

The three figures in the text are reproduced by permission of Messrs A Charles King Ltd of Devonshire Street W 1

BLOOD TRANSFUSION CONGRESS IN PARIS

The second International Blood Transfusion Congress was held in Paris September 29 to October 5 under the presidency of Professor Gosset Twenty two nations were represented and over 100 reports and communications were made The secretary general was Dr Arnault Tzanck Dr H I Brewer Dr S C Dyke Mr P L Oliver and Mr V H Riddell were among the British representatives

The following four subjects were studied by special committees (1) Blood groups (2) Preserved blood (3) Haematological problems (4) Questions of organization

Blood Groups

The special committee on this subject concluded that a single classification of blood groups was essential and recommended that of A_6 B_1 AB_0 and O_3B It confirmed the opinion that blood groups are unchangeable and that errors due to pseudo agglutination were avoidable notably by dilution of the serum Direct matching between donor and recipient was always advisable, especially in medical cases

The committee also came to the conclusion that there was no proof of the existence of "universal donors" whose serum was dangerous owing to high titre of agglutinins A matching test should precede each repeated transfusion and it was recommended that the injection of a small quantity of the donor's blood before beginning the actual transfusion might well be further studied The official control of commercially supplied testing sera was essential and standard testing sera should be of high titre and tested periodically against corpuscles from the same subject

In cases of urgency and when it was not possible to secure a universal donor or to obtain standard sera direct proof of compatibility (testing the donor's corpuscles against the recipient's serum) was essential In repeated transfusions it was useful before each transfusion to verify that the serum of the recipient neither agglutinated nor haemolysed the red corpuscles of the donor

Preserved Blood

The committee praised the excellent work done in existing centres for providing fresh blood for transfusion, but to meet the need of scattered communities it was thought that regional centres should be set up from which stored blood could be distributed at need Blood which was to be stored should be collected in the morning from a fasting donor and with the minimum of manipu

DR F W BURTON-FANNING

Sir Humphry Rolleston writes

From a friendship starting when he was house physician at Addenbrooke's Hospital, Cambridge, I may perhaps add a few lines about a man who thoroughly deserved his long trust as a consultant in East Anglia Like all connected with Addenbrooke s in those far-off days, he came under the influence, and sometimes, as administrator of anaesthetics, under the eye, of that great teacher Sir George Humphry, who was powerful in securing Burton's appointment in 1891 at an early age to the vacant physiciancy at the Norfolk and Norwich Hospital As there were already two members of that hospital's staff with names which might possibly be confused with his own—the late S H Burton, surgeon, and J H Barton, physician—this was avoided by the addition of his mother s maiden name, and he became Burton-Fanning Intensely interested in clinical medicine, he was an all-round physician, as shown by published papers on rat-bite fever, neurasthenia in soldiers, and examination of the under-average life for assurance He was also a pioneer in the open-air treatment of pulmonary tuberculosis in the east of England forty-two years ago, and later keenly went through a course on Wright's opsonins

Remarkable for his kindly attitude to all and sundry, patients became lifelong friends, and his inquiries were first and all the time directed to the interests of his friends, never to his own concerns This pleasant trait, though an index of modest unselfishness may have made others overlook his achievements When, after his thirty-seven years of devoted service, the age limit in 1928 necessitated retirement from the active staff of the hospital, he remained its firm friend, and was energetic in connexion with its artificial pneumothorax clinic and nursing arrangements His personal qualities and professional abilities were recognized and wisely utilized by the Norwich Union Life Insurance Society

We regret to announce the death, on October 31, of Dr CLAUDE WILSON, the well-known Tunbridge Wells physician, who published a number of thoughtful papers on cardiology in these columns and elsewhere He was born in Liverpool in 1860, and studied medicine in Edinburgh, London, Manchester, and Vienna, graduating M B, C M Ed, with honours, in 1884 After holding the posts of resident physician at the Edinburgh Royal Infirmary and professor s assistant in clinical medicine and patho logy, he proceeded to the M D in 1887 Dr Wilson joined the British Medical Association in 1887, served on the Central Council on two occasions, was chairman of the Tunbridge Wells Division in 1927–8, and president of the Kent Branch in 1934–5 He was elected a Fellow of the Royal College of Physicians of London in 1933, having taken the membership seven years earlier, and was a member of the Association of Physicians of Great Britain and Ireland A keen mountaineer, he was a member of the Swiss-Alpine and the Scottish Mountaineering Clubs, a vice-president of the Alpine Club, and author of the article "Mountaineering" in the All-England Series His last paper in the *British Medical Journal* was an address entitled "Some Recent Advances in Cardiovascular Diseases"

We regret to announce the death on October 26 of Dr MAJORIE ADA BLANDY wife of Dr James Purdon Martin and a member of the well-known Madeira family She was educated at Kensington High School, Jersey Ladies College and Newnham College, Cambridge and took the Natural Sciences Tripos in 1908 She then began the study of medicine at the London School of Medicine for Women taking the English conjoint diplomas in 1914, the M B, B S.Lond degrees in 1917 and the M R C P in 1922 During the first year of the war she was attached to the R.A M C, and served at the Boulogne base Dr Blandy was then in turn house-physician at the Royal Free Hospital and the Great Ormond Street Hospital for Children, medical registrar and resident medical officer at the National Hospital, Queen Square (where her husband is now physician to out-patients), and was appointed assistant physician to the Garrett Anderson Hospital in 1923 She was also physician to the Bermondsey medical mission hospital, and in recent years took part in the infant welfare work of the Hampstead Council of Social Welfare In her student days she was a noted athlete, representing Cambridge and later London University at hockey and swimming She had been a member of the British Medical Association for the past twenty years

Dr FRANCIS WILLIAM O CONNOR assistant director of the Division of Medical Education Rockefeller Foundation, died on October 2, aged 53 Before going to New York in 1922 he had been for some years demonstrator in medical entomology at the London School of Tropical Medicine, and then leader of an expedition to the Western Pacific islands He studied medicine at St Bartholomew s Hospital and qualified as M R C S, L R C P in 1907, taking the Cambridge diploma in tropical medicine and hygiene in 1913 During the war Dr O'Connor served with a commission in the R A M C in France, Egypt Sinai, and Salonika He published papers on intestinal protozoa in collaboration with Dr C M Wenyon and Mr Clifford Dobell, and had made a name for himself by long continued and exhaustive studies of filariasis At the Annual Meeting of the British Medical Association at Brighton in 1913 he was honorary secretary of the Section of Tropical Medicine

The death took place at Newton, Massachusetts, on October 10, at the age of 90, of Dr WILLIAM HUNTER WORKMAN, who made many important mountaineering and exploring expeditions and lectured to geographical and scientific societies in all parts of the world He was a B A of Yale and an M D of Harvard, and practised for some years at Worcester, Mass

The following well-known foreign medical men have recently died Professor VALDIGUIE formerly director of the laboratories of the Pasteur Institute and professor of medical chemistry at Toulouse, Dr WILLY PFEIFFER, professor of oto rhino-laryngology at Frankfort, aged 59, Professor FEDOR KRAUSE for many years senior physician to the Augusta Hospital Berlin, and Dr LOUIS JACOB JOSEF MUSKENS of Amsterdam, an authority on epilepsy

The Services

DEATHS IN THE SERVICES

Surgeon Commander ALEXANDER GORDON TAYLOR R N, died in the Royal Naval Hospital at Plymouth on October 21, aged 48 He was educated at Durham University where he graduated M B and B S in 1915 entering the Navy soon after He attained the rank of surgeon commander on November 11, 1927 He served throughout the war of 1914–18, receiving the medals

Lieut.-Colonel HAROLD CROSSLEY HILDRETH D S O O B E, R A M C (ret) died on September 11 in London, aged 60 He was born on October 25, 1876 and took the Scottish triple qualification in 1900 and the F R C S Ed in 1902 After serving as assistant medical officer of the Sierra Leone Railway he entered the R.A M C as lieutenant on August 31 1903 became lieutenant-colonel on June 30 1926, and retired on March 1 1929 He served throughout the war of 1914–18 was mentioned in dispatches in the *London Gazette* of January 1 1916 and May 29 1917 and received the D S O and the O B E

Colonel GEORGE MILLS GOLDSMITH C B E, late R.A M C, died at Marlborough on September 13, aged 61 He was born on July 11, 1876 and was educated at Trinity College Dublin, where he graduated M B B Ch, and B A O in 1898

no motive for concealing the truth or had by conversation confided that revelation to someone who was capable of reporting it accurately Mr Gladstone's motive was a sincere deeply held religion but a religion of a kind which was always a rarity confined to a small group, and now infinitely difficult for any man, believer or unbeliever to reconstruct Perhaps after all Mr Guedalla reflected we must be satisfied with a faithful portrayal of external adventures and this at least would be preferable to some biographies of fifty years ago which portrayed a stained glass window

Two Currents in English Biography

The lecturer gave a brief sketch of the history of biography beginning with that of Socrates who was the creation of Plato no less than Johnson was the creation of Boswell The great era of biography was the nineteenth century with such works as Moore's *Byron* Lockhart's *Scott* Trevelyan's *Macaulay* Some young people maintained that in the nineteenth century the stream of biography somehow went astray Mr Guedalla did not share that view but he did detect two separate currents in English biography—the brilliant unofficial work on the one hand, and the more dignified and authoritative official compilation on the other On the unofficial side was Rosebery's *Pitt* one of the most brilliant works ever written also Rosebery's *Napoleon The Last Phase* Edmund Gosse's *Coventry Patmore* and Lytton Strachey's *Queen Victoria* On the official side there were such works as the Lives of their respective fathers by Hallam Lord Tennyson, and by Mr Winston Churchill

The war Mr Guedalla added did not bring any shattering innovation into biography Certainly it enlarged the public curiosity about persons which had to be satisfied by rather dubious speculation and the general relaxation in moral standards also made people rather more indulgent than they ought to have been to the invasion of biography by fiction and conjecture But apart from that the post war world was not unlike the pre war Mr Guedalla read in proof thereof a few passages from classical pre war biographies to show that neither fine irony nor sombre death bed eloquence was the monopoly of post war writing The proper pursuit of the biographer lay in the middle of the road between these two styles of official and unofficial narrative He should try to achieve a blend of the solid documentation and accuracy which made official biography so valuable together with the freer play the irony, where this was relevant, and the good writing if by God's grace he was capable of it which characterized the best of unofficial biographies The disproportion of the official biography its tendency to run to more than one volume should be discouraged also its habit of over praise (though this might be difficult when the executors were looking over the biographer's shoulder), while the inaccuracy the slovenliness the positive invention the smart allegory of the lower order of unofficial biography were equally to be avoided

Mr Guedalla's lecture was delivered on the occasion of a reception by the President of the Royal Society of Medicine (Sir John H Parsons) and a conversazione, which was largely attended

The second edition of *The Colonial Medical Service List* in which the schedule of offices has been revised to August 1937 is now available This publication also contains an alphabetical list of members of the service with brief biographical details The prefatory note to the *List* states that while every care has been taken in its compilation accuracy is not guaranteed and officers desiring additions or corrections should communicate direct with the editor of *The Colonial Medical Service List* at the Colonial Office Copies of the *List* may be obtained from H M Stationery Office price 1s 3d net

BALNEOLOGY CONGRESS AT BUDAPEST

CENTENARY OF ROYAL MEDICAL SOCIETY

The 100th birthday of the Royal Medical Society of Budapest was celebrated on October 6 by a meeting in the great hall of the Royal Hungarian Academy of Sciences The Archduke Joseph Francis presided and the president Professor Verébely gave an address of welcome to the three hundred foreign delegates who had assembled to convey the greetings of the other chief medical societies of the world Certain of them including the representative of the Royal College of Physicians of London were then invited to reply which they did some of them briefly A ceremonial lunch at which the Archduke presided, was held in the Casino on Margaret Island a privately owned and pleasantly wooded island suburb lying in the Danube The delegates were then taken by car and shown round the Budapest spa establishments situated in various parts of the town and the improvements which have recently been carried out for the comfort of patients and visitors by the municipal authorities

The next morning the inaugural ceremonies in connexion with the International Balneological Congress took *place more than 350 foreign delegates being present from* the Governments and learned societies of the world The Corps Diplomatique, including the British Minister also attended and expressed themselves edified by the subsequent discussion on radioactivity which was opened by Professors Imre and Von Pap On this and subsequent days the speakers included Professors Klinge (Germany) Kahlmeter (Sweden) Darányi (Hungary—a brother of the present Prime Minister) Alois Strasser (Vienna) Besançon (Paris) Eiselsberg (Vienna) Donald Guthrie (U S A) and Koranyi (Hungary) while the British post graduate lecture on the relationship of tuberculosis and rheumatoid arthritis was given by Dr W S C Copeman (London)

A New Spa Federation

The Congress then divided into sections Economic, Medical Technical 'Tourisme' and Advertising—which met on four days at the Hotel St. Gellert and were well attended The Section of Jurisprudence in conjunction with the Medical Section later drew up skeleton proposals for the establishment of an International Spa Federation the discussion of which formed the basis of most of the subsequent meetings On the last day the Congress formally approved the formation of this body, electing the Archduke Joseph Francis as President and naming Budapest as its headquarters for the present It was decided that a further council meeting of all foreign delegates should be held in Budapest next Easter and that the first full congress of the new federation be held in Berlin later in the year This congress it was agreed should subsequently meet every two years in France in 1940 and in Italy in 1942 Among the subjects discussed as being proper to such a body were the standardization and inspection of facilities at spas in all countries propaganda and all matters concerning tourisme medical hydrology in its theoretical and practical applications and all matters concerning hotels and administration in health resorts

Social Activities

A considerable number of excellent dinners and receptions were offered to the delegates during their stay notable among these being the dinner given by the Chief Burgomaster of the City at which the Prime Minister and six of the other chief Ministers were present and that of the Archduke and Archduchess Joseph Francis at which over 500 people were present and from which the speeches of the chief Government delegates were broadcast to the country at large The Minister of the Interior also gave a large reception on behalf of the Royal

Medical Notes in Parliament

New Bills

The Population (Statistics) Bill was introduced by Sir Kingsley Wood on October 28 The object of this Bill is to extend the scope of the particulars which can at present be asked for upon the registration of a birth, stillbirth, death or marriage, and by this means to provide the statistical evidence needed for the practical consideration of the problems in regard to the future population of Great Britain to which the decline in the birth rate has given rise The Bill provides that such further particulars shall be obtained in confidence for statistical purposes only, and not for entry in the register As in the case of a census, the particulars asked for are to be regulated by Orders in Council which must be laid in draft before Parliament

MEDICAL BENEFIT FOR BOYS AND GIRLS

The National Health Insurance (Juvenile Contributors and Young Persons) Bill, which the Minister of Health introduced on October 27, will make provision for medical benefit under the National Health Insurance Act to boys and girls who on leaving school become employed before reaching the age of 16 and will thus bridge the gap between the school medical service and the beginning of full insurance under the National Health Insurance Act About a million boys and girls are expected to come under the scheme The cost of medical benefit for these juvenile contributors and its administration will be defrayed like existing health insurance benefits It is estimated that the cost of benefit, including the capitation fee to doctors, the supply of medicines, and the administration expenses, will be 13s per head per annum

PENSIONS FOR THE BLIND

The Blind Persons Bill will reduce the age at which pensions can be paid to blind persons under the Old Age Pensions Act, 1936, from 50 to 40 years

Mr F O Roberts who secured the sixth place in the ballot for leave to introduce Bills, presented on October 29 a Local Authorities (Hours of Employment in connexion with Hospitals and Institutions) Bill—'to provide for the limitation of hours of work for persons employed in or in connexion with hospitals and institutions under the control of local authorities' Dr Haden Guest presented a Bakehouses Bill 'to prohibit night work in bakehouses" The former is set down for second reading on December 3 and the latter for February 18

Debate on the Address

The debate in the House of Commons on the Address in reply to the King's Speech was resumed on October 27 by Mr ARTHUR GREENWOOD He said that a report published by the Ministry of Health in 1932 on diet in Poor Law children's homes showed that in an institution with 200 children, where all provisions were obtained at contract prices, an expenditure of 4s 6½d per child per week was necessary for feeding alone For the housewife who had to buy in small quantities that diet could not be bought under 5s 6d a week Working-class incomes would not enable families to live at the proper standard of physical efficiency, and yet malnutrition was not mentioned in the King's Speech

SLUM CLEARANCE AND NUTRITION

Sir KINGSLEY WOOD said that the five years programme of slum clearance had been more than kept Already the houses in submitted Orders exceeded 186 000 which was 90 per cent of that programme The original programme for slum clearance had been extended and the revised one now covered over 400 000 houses Some 650 000 slum dwellers had gone to better homes The figures he gave were for England and Wales Practically all the local authorities of the country had fixed the days from which the overcrowding provisions were to operate A number had reported that 20 per cent of overcrowding as disclosed by the survey had been abated The programme of slum clearance and overcrowding still involved the erection of some 300 000 new houses in England and Wales He was not satisfied with the progress made in rural housing, and he would submit his proposals to the House for Exchequer assistance towards the general provision of cottages for agricultural workers to be let at low rents These proposals would cover Scotland, and he would have to consider whether grants should be refused unless the houses had running water The Ministry of Health was making efforts to secure a wider use of the provisions under the Housing (Rural Workers) Act for bringing existing country properties up to date and had already received applications for over 12 000 dwellings

Concerning what Mr Greenwood had said about nutrition it was only under the present Government that the nutrition problem had been seriously considered, and though only tentative steps had been taken this country was ahead of any other in its policy on nutrition and public health. The Advisory Committee attached to his department, which included Sir John Orr, Professor Cathcart, and other leading men of experience, agreed about the nutritional value of milk The recent report of that committee was the most valuable document which had been issued on the subject of nutrition in any country, and it reported on the great value of milk, especially to mothers and children On receiving that document he had asked local authorities to review their arrangements for the supply of milk and other foods with a view to securing that the diet, particularly of expectant and nursing mothers, combined the proper constituents, and that the consumption of milk especially by young children, should be increased He also suggested the relaxation of restrictions on the supply of milk and other foods Forty-seven local authorities had already improved their income scale, sixty two had increased the amount of milk supplied per case, a number had extended the period of supply of milk for expectant mothers and children under 5, and a number had arranged for the pasteurization of milk

INQUIRY INTO NURSING SERVICE

A great deal was also being done in attacking the problem of maternal mortality Schemes under the new Midwives Act were in operation over the greater part of England and Wales and he expected all of these new services to be in operation in January He hoped to receive the report of the Committee on Abortion at an early date, when he would publish it and consider what action, if any, was recommended He was glad they had already improved the status and remuneration of midwives, and he hoped they might be able to do the same for nurses He was about to set up a committee to inquire into the conditions of recruitment and service of the nursing profession

Sir FRANCIS ACLAND said the minimum the House should accept was a scheme to provide milk for all nursing and expectant mothers, for children below school age, and, wherever possible, to extend the milk in schools scheme to Saturdays and Sundays

WAR DISABILITIES CRITICISM OF MINISTRY OF PENSIONS

Mr ELLIS SMITH asked for an investigation by a Select Committee of the House into the position of ex service men and particularly the policy pursued by the Ministry of Pensions A report issued in 1935 by the Officers' Benevolent Department of the British Legion showed that 65 per cent. of the cases dealt with by that department did not concern men who had been wounded, but men suffering from nervous disorders, diseases of the heart tuberculosis, and other ailments The Officers Benevolent Society criticised the attitude of the medical advisers of the Ministry of Pensions in face of the opinion of doctors who were in constant attendance on patients for war disabilities and gave certificates in support of their claims Even the opinions of specialists were ignored when certificates were sent

Sir FRANCIS FREMANTLE said there was an instruction of the Ministry of Pensions that the medical officers should always give the benefit of the doubt Mr BURKE replied that if there was such an instruction it was not acted upon

Sir FRANCIS FREMANTLE drew attention to the reference in the Speech from the Throne to the question of health and

INTERNATIONAL SOCIETY OF SURGERY

The eleventh Congress of the International Society of Surgery will be held in Vienna under the patronage of the Austrian Government from September 19 to 22, 1938 The meetings will be held in the Konzerthaus under the presidency of Professor R Matas of New Orleans The subjects chosen for discussion are the surgical treatment of hypertension bone grafting and the surgical treatment of cysts and tumours of the lung In order to simplify language difficulties the organizing committee has decided to install the latest pattern of microphone relay apparatus in the lecture hall which will enable members to understand the speakers of their choice in one of the official languages of the society In addition to the scientific session the morning of Thursday September 22 is to be devoted to surgical operations and there are several social functions already arranged

The general secretary of the International Society of Surgery is Dr L Mayer of 72 Rue de la Loi Brussels and Professor Grey Turner of the British Postgraduate Medical School Ducane Road London W 12 and Professor Lambert Rogers of the Surgical Unit Royal Infirmary Cardiff are the British representatives on the international committee Applications for membership should be made to any of these gentlemen The travel arrangements will be in the hands of Messrs Thomas Cook and Sons and in due course a detailed itinerary will be issued by that firm

CINEMA DEAF-AID INSTALLATION IN A SCHOOL FOR THE DEAF

Lord Horder addressed an assembly at the Royal School for the Deaf and Dumb at Margate on October 22 where a demonstration of a cinema deaf aid installation for the use of the pupils was given He spoke in high praise of the research work in the use of deaf aids that was being carried out in the school. Referring to the benefit derived from the use of these aids he drew attention to the fact that as the children were enabled to hear better (which was followed by greater development of speech language and the emotions) there took place side by side with this a development of the mental activities which was of the greatest importance to the child This is the first school for the deaf in which sound films have been used for educational purposes in this country

The cinema deaf aid installation works in conjunction with a Pathé talking picture equipment and additional provision is made to enable a speaker to address the children through a microphone Part of the speech output—10 watts—from the sound amplifier of the talking picture equipment which has been slightly modified for the purpose is led to a volume check device which enables deaf listeners to obtain the considerable volume of sound necessary for them on the weak passages without the loud sounds in the programme becoming excessively strong From this device the signals are led to sockets connected with the wiring system where the apparatus of the individual pupils may be plugged in The automatic volume-check device also prevents undesirable effects on the ears of listeners which might be produced by loud noises such as gun firing in the course of the film The equipment for each pupil consists of a pair of light weight head phones to which are connected independent volume and tone controls which can be adjusted to suit the requirements of the individual The tone control is particularly valuable for cases of internal ear or nerve deafness in which it is usually necessary for the high tones to be stronger than the low Each pair of ear phones is designed to give "unmasked hearing This means that the amount of bass in one of the ear phones is cut down with respect to that in the other irrespective of the tone-control setting It has been found that the large volume of sound required by deaf listeners can be given without loss of the distinctness that is normally associated with sounds of high intensity owing to the masking of the higher frequency components by the lower when volume is increased This special apparatus was designed and supplied by the Multitone Electric Company

Before the film was shown a demonstration indicated the great assistance the children had from the use of the hearing aid One of the teachers spoke from the platform in turn to several pupils who had the hearing aid adjusted to their ears and their response was immediate He then spoke to them when the ear phones were discarded and none could reply In both cases the face was turned away from the teacher to prevent lip-reading

The children showed enthusiasm and it was obvious that an interest and pleasure had been brought into their lives which without the assistance of the hearing aids they would not have been able to experience

Reports of Societies

TREATMENT BY INTRAVENOUS INFUSION

At a meeting of the Medical Society of London on October 25, Mr J E H ROBERTS presiding a discussion took place on treatment by intravenous infusion

Dr GEORGE GRAHAM in opening said that he did not propose to speak about blood infusions but to restrict his remarks to the giving of water containing the different salts which were present in blood The usual solutions were normal saline 0 9 per cent hypertonic saline 2 to 5 or even 10 per cent glucose 5 to 10 per cent sodium bicarbonate 2 per cent or some combination of these The water should always be distilled In grave emergencies it was possible to use tap water without serious results but this should not be necessary in the ordinary case On the other hand there was no basis for the belief that the water must be distilled three times in order to avoid causing any reaction One distillation got rid of all impurities Intravenous solutions were used in the treatment of a variety of conditions but the most important were those in which great alterations of body fluid had occurred—namely such conditions as cholera bacillary dysentery severe diarrhoea severe vomiting due to pyloric obstruction or acute dilatation of the stomach and diabetic coma Another group of cases was that in which the symptoms were not so acute though equally severe—namely patients who were unable to take fluid for some reason patients with septicaemia and patients with surgical shock He stressed the need for careful consideration of the amount of salt given Fantus had published an interesting paper in which he had analysed the results of 2,000 cases where the injection of 2 000 to 7 000 c cm a day had been given and he made the observation that the sicker the patient the more fluid was given and the greater the mortality Fantus also thought that it was important to estimate the fluid excreted for if the kidney could not excrete more than 10 per cent of the intake the mortality was high Similarly the chloride output should be estimated if it was excreted in a concentration of less than 0 1 per cent the mortality was over 75 per cent

Dr Graham also referred to another important condition which could be helped by intravenous infusion—namely renal failure associated with a high blood urea In this condition if the alkali reserve was reduced to 45 volumes of CO per 100 c cm blood alkalis could safely be given by mouth unless the patient was very ill If the alkali reserve was lower than 45 volumes and the patient was seriously ill the alkali should be given intravenously sufficiently to raise the alkali reserve above 50 volumes when the alkalis should be given by mouth If the alkali reserve was normal (55 to 70 volumes) or raised the renal condition could usually be improved by daily infusions of 600 to 1,000 c cm In these cases a 5 to 10 per cent solution of glucose either with or without normal saline was very useful The sugar in the blood was considerably raised by this procedure and in some way caused a diuresis, and the increased flow of urine

Medical News

A home for private patients, which has been built in close proximity to the Manchester Royal Infirmary, will be formally opened on November 15 The ceremony will be performed by Lord Dawson of Penn, P R C P, who will be accompanied by Lord Derby, the president of the Infirmary Accommodation is provided on four floors for 100 patients, and the home is directly linked to the Infirmary

The presidential address, entitled "Civilization," will be given to the British Institute of Philosophy by Lord Samuel on Tuesday, November 16, at 8 15, at University College, Gower Street W C Cards of admission may be obtained from the Director of Studies at University Hall, 14, Gordon Square, W C 1

The annual clinical "At Home" of the Royal Dental Hospital of London will be held on Saturday, November 20 at 3 p m, and the dinner of the past and present students of the hospital will be held at the Trocadero at 7 for 7 30 p m the same day

The annual congress of the British Institute of Radiology will be held at the Central Hall, Westminster S W, on December 8, 9, and 10 Queen Mary has consented to be present at the opening ceremony on December 8 Admission to this ceremony will be by ticket only and members should make application to the general secretary, 32, Welbeck Street, W 1, stating the number of tickets required

The next clinical meeting of the Society of Radiotherapists of Great Britain and Ireland will be held on November 19, when Lord Horder will open a discussion on "The Treatment of Hodgkin s Disease" Drs Bromley, Levitt, and Raban and Professor McIntosh and Mrs Hilton will also speak

At a meeting of the Pharmaceutical Society of Great Britain, to be held at 17, Bloomsbury Square, W C., on Tuesday, November 9, at 8 30 p m a lecture on 'Early Herbals' illustrated by lantern slides, will be given by T A Sprague, D Sc, deputy keeper of the herbarium and library, Royal Botanic Gardens, Kew

A course in puericulture will be held at the École de Puériculture, 26, Boulevard Brune, Paris 14e, beginning on November 15, under the direction of Professors Couvelaire, Lereboullet, Nobécourt, and Dr Weill-Hallé Further information can be obtained from the Secretary of the School

The meeting of the Illuminating Engineering Society on November 16 at the Lighting Service Bureau, 2, Savoy Hill, W C, at 6 30 p m, will be given up to a discussion on lighting for special industrial processes

The Minister of Health will lay the foundation stone of the new department for rheumatism and arthritis of the Hospital of St John and St Elizabeth, St John s Wood, N W, on Wednesday, November 10, at 3 p m

The Board of Education has appointed Miss E A Langley, who is at present organizer of school meals for the London County Council, to fill a new post on its staff as inspector of the arrangements made by local education authorities for the provision of meals, in co-operation with the Board s medical staff

Of the three national prizes for Art and Science recently awarded by the Führer at Nuremberg two, of the value of RM 50 000 each were divided between the two surgeons, August Bier and Ferdinand Sauerbruch

Mr Walter Elliot, Secretary of State for Scotland, has ordered an inquiry into the recruitment of nurses in Scotland and has appointed for this purpose a committee with Lord Alness as chairman.

The Buckston Browne Prize for 1937 has been awarded by the Harveian Society of London to Reginald Theobald Payne, M S, M D, F R C S., for his essay on "Phlebitis"

On October 29 a first consignment of drugs, costing £8,800, was ordered by the Medical Supplies Committee of the Lord Mayor's Fund for the relief of distress in China It is being dispatched this week, and will be followed immediately by supplies of dressings, surgical instruments, sera, and vaccines

Professor W W Jameson, Dean of the London School of Hygiene and Tropical Medicine, has been invited to act as an external assessor in the public health examinations of the Kitchener School of Medicine, Khartoum, in December of this year He will take the opportunity of visiting also the medical schools for the training of African natives in Nigeria and in Uganda Professor Jameson left London for West Africa on November 3, and expects to return about the middle of January next

QUERIES AND ANSWERS

Natural Sunlight and Ultra-violet Light Therapy

Dr R A JOHNSON (Golden Rock S India) writes I shall be obliged if any of your readers can advise me how the natural tropical sunlight of South India could be modified so as to be utilized therapeutically as ultra violet light at all hours of the day Clear sunshine is superabundant here and the supply is almost constant throughout the year It is unsuitable however, for therapeutic purposes owing to its containing, I understand, too great a proportion of infra-red rays Maximum daily shade temperature here varies from about 110 in June to about 80 in December Sun bathing is usually not recommended except before 8 30 a m or after 4 30 p m Hence in our hospital we have recourse to a mercury vapour lamp for ultra violet light therapy, which may seem to some people like bringing coals to Newcastle Would the use of a filter of violet tinted vita glass modify the natural sunlight suitably? If so, where can such glass be obtained?

Haemoglobin Estimation

J B L" inquires In estimating the haemoglobin content of a sample of blood by Sahli s method what interval of time should elapse after the blood has been added to the decinormal HCl before dilution with distilled water is proceeded with?

prontosil had been a little more impressive, though it might be that further experience would reverse the verdict

There was likely to be a number of new compounds brought forward for all sorts of infections, and it would be necessary to tackle the problem as to whether and how far any one was better than any other It seemed inevitable that new drugs should go through two phases before they could be got into true perspective with regard to their toxic effects In the first phase the toxic effects received too little emphasis in medical journals, and in the second, too much The medical press was now being flooded with accounts of cases of toxic effects without the background of the large number of cases which showed no such effects At Queen Charlotte's roughly 150 cases had been treated with sulphanilamide for periods of from one to two weeks and about fifty cases for shorter periods (one or two days), and in addition nearly seventy cases with red prontosil Of the toxic effects seen by far the most prominent had been cyanosis More than 50 per cent of the cases treated with sulphanilamide had shown this to some degree in the majority very slight, and in only three accompanied by an alarming amount of prostration There were some cases of what the Americans *were now calling drug fever, and two cases of mental disturbance with a curious type of hysterical fits not seen* previously in puerperal cases Apart from this there had been headaches in a certain number of patients slight dizziness, occasional visual disturbance and in one case diminution of tactile sensation In two cases there was slight jaundice Anaemias had not been seen but routine blood counts had not been done

It seemed likely that some people were particularly susceptible to these drugs The drugs should not be sold over the counter or given save by medical prescription nor should they be used as a shot in the dark for the treatment of infections where there was no reason to suppose they would do any good nor should they be used casually for obstetric prophylaxis The drugs were better tolerated by patients in bed than by those up and about Finally it would be well to keep in mind that all the products on the market were not uniform When Ehrlich was in this country in 1913 he said that some risk must be run if effective chemotherapy was to be undertaken The lesson of 606 should be remembered As soon as it was realized that '606 might have some toxic effect the manufacturers went to work to produce substances less and less toxic but they had the demerit of being less and less curative

Animal Experiment

Dr G A BUTTLE gave some account of experiments on infected mice on which the curative action of sulphanilamide had been tested Mice infected with 10 000 lethal doses of haemolytic streptococcus had been cured by sulphanilamide The best results were obtained by giving the drug for fifteen days after infection The meningococcus was the most susceptible organism in the mouse experiments Mice infected with 1 000,000 lethal doses could be cured by a single dose of sulphanilamide There was also some slight clinical evidence of usefulness The gonococcus was as susceptible as the meningococcus *in vitro* No experiments had been done on mice Mice infected with 100 fatal doses of *B typhosus* or *B paratyphosus* had also been cured by a single dose of sulphanilamide, as had mice infected with 10 000 fatal doses of *B dysenteriae* (Sonne) Cured mice were immune to further infection There were no clinical reports on typhoid but the results in urinary infections with coliform strains were good according to reports in England and America In the case of mice infected with the staphylococcus, temporary protection was afforded for ten days against 10 000 lethal doses but the animals eventually died of multiple abscesses Most animals infected with 100 fatal doses survived with treatment The staphylococcus was more difficult to get rid of than the streptococcus Good results had been shown in rat pneumonia with the Type III pneumococcus In the case of Types I and II sulphanilamide only delayed death There were better results with benzilidine Schiff's base of 4 4-diamino diphenylsulphone Recovered mice were immune to further infection As to the mode of action of the drug sulphanilamide did not destroy streptococci in blood from which the leucocytes had been removed as it did in whole blood In de leucocyted blood streptococci grew for the first two or three hours at the same rate irrespective of whether sulphanilamide had been added or not, but after four hours there was no further increase in the numbers of the cocci in the sulphanilamide whereas the numbers went on increasing in the control Sulphanilamide delayed the growth of the cocci, perhaps it also damaged them in some way and enabled the leucocytes to phagocytose them

Treatment of Scarlet Fever and Other Infections

Dr MAURICE MITMAN gave an account of some clinical trials with the benzyl derivative proseptasine in the practice of the Eastern (fever) Hospital When the original *success with prontosil in septicaemia was reported it had* seemed reasonable to infer that the drug must influence the complications of scarlet fever At the time the investigation began reports of the toxic effects of the drug used in septicaemia were accumulating, and there seemed to be a distinct possibility that the treatment might be more dangerous than the disease It was then represented to the investigators that the benzyl derivative was less toxic and it was decided to use this The cases of scarlet fever investigated numbered 355 four wards were reserved for the investigation and placed in charge of one medical officer The results were disappointing No significant difference was observed in the duration of the initial pyrexia or in the appearance of complications as compared with controls At the same time fifty nine cases of erysipelas were treated with the same preparation with good results The fatality rate of erysipelas of the extremities was 20 per cent There had been nine such cases in this series and all had recovered Since the introduction of proseptasine patients with erysipelas had ceased to give him any serious anxiety There was a rapid improvement in toxic symptoms and the duration of stay in hospital had been considerably shortened As to the reason for the failure of the drug in scarlet fever there was a possibility that the haemolytic streptococci responsible for this infection were relatively more resistant to the drug than other strains Dr HOGARTH Dr Mitman's colleague who had been in charge of the cases of scarlet fever under investigation gave some further details and statistics Dr G DISCOMBE gave an account of a series of cases treated for various complications at St Bartholomew's Hospital with sulphanilamide and benzyl sulphanilamide and in a few cases with red prontosil None had shown any very serious toxic effects One case exhibited a considerable degree of cyanosis but recovered

Dr E P POULTON mentioned some cases which might be grouped under the heading of occult haemolytic infections Resistant cases did appear to do quite well with these substances In a group of continuously febrile cases of a chronic nature the temperature was certainly lower during the period of prontosil treatment than at other times Then there was the chronic rheumatoid arthritis patient, perhaps afebrile or with spikes of temperature In these cases those concerned could not satisfy themselves that there was any difference between this treatment and other methods employed He also mentioned a patient with abdominal actinomycosis who ran a fever for a considerable period and could only take *relatively small* amounts of iodine or x ray treatment The effect of sulphanilamide in this case was remarkable, the temperature coming down in five days The patient put on weight and was transferred to a convalescent home

Cost of Board of Assistant

"R H" refers to a reply given two years ago to the effect that normally £2 2s per week is regarded as a reasonable charge That amount is queried by the local inspector of taxes

*** While £2 2s is reasonable as a general working rule, the actual cost to the practitioner must vary within fairly wide limits—for example as between board etc, in an expensive suburb or fashionable seaside town on the one hand and a small provincial town on the other, also on the general scale of living provided the degree of economy of management exercised, and so forth Failing agreement on broad lines with the inspector "R H should investigate actual household expenditure and add a suitable amount for domestic wages etc

LETTERS, NOTES, ETC

Lichen Urticatus

Dr G E ELLIS (Bourton, Dorset) writes I was interested in the article on lichen urticatus in the *Journal* of August 28 (p 425) About eight years ago I was treating a particularly obstinate case with calcium in the form of syr calc lactophos I noticed that the child s urine was highly acid and thinking that this might have some connexion with the cause of the eruption rendered it alkaline with potassium citrate An immediate cure resulted and since then I have treated all cases with this salt I hardly ever have a failure and I find that it is unnecessary to give doses sufficient to cause an alkaline reaction of the urine Doses of five to ten grains three times a day for four days are usually sufficient to effect a cure Subsequent attacks in the same child are cured just as easily

Anatomy of English Chair Types

The lover of old furniture will read with interest Dr J N Loring s The Anatomy of English Chair Types,' a collection of five illustrated articles reprinted from the *Antique Collector* The author pleads for a classification of the English chair of the eighteenth century on constructional or comparative anatomy lines with a series of useful illustrations There appears, however, little prospect of the familiar period classification yielding to the constitutional claims The student of this subject will prefer to associate development of style with a historical background and reserve his anatomical study to the method of construction and evidence of the 'doctor s attention The pamphlet is published by the *Antique Collector* 5, West Harding Street, E.C 4, price 2s 6d

Use and Abuse of Benzedrine

Major W H CRICHTON I M S writes from Switzerland Permit me to refer to the leading article on the use and abuse of benzedrine which appeared in the *Journal* of September 25 (p 625) It seems to me possible that in issuing the timely warning on the abuse of this drug taken internally its undoubted value as an astringent of the nasal mucous membrane will be lost sight of Some months ago I received a physician s sample of benzedrine put up in a container for the purpose of inhalation I have no hesitation in stating that applied judiciously in the manner indicated by the manufacturers it is a most effective agent for the relief of nasopharyngeal congestion associated with the common cold, as well as for the prevention or attenuation of this affliction once the early symptoms manifest themselves I am normally subject to two or three colds a year since using benzedrine as an inhaler I have been able to prevent or to suppress every cold ' early in its development. I may add that this experience has been corroborated by many of my colleagues in India Except on one occasion when I foolishly used the inhaler oftener than I should have done I have never experienced any unpleasant symptoms and in this case they were confined to a bad headache

Whortleberries

Dr J H KEPPEL-COMPTON writes When so many letters have appeared in the Press on the whortleberry which is said to be a corruption from myrtleberry it is curious that no mention has been made of its medicinal properties The late Dr Combe professor of the children s clinic at Lausanne and author of *Traitement de l'entérite mucomembraneuse* used the juice of 'les myrtilles" extensively as an intestinal antiseptic in his clinic at Lausanne, where it is still given In Middle Europe whortleberries are called 'Heidelbeeren Besides being a popular fruit, they are given by medical men as an intestinal antiseptic When practising in Italy I found "Mirtillo fruit juice useful in cases of intestinal dyspepsia

Nurses' Fund for Nurses

An appeal is being issued to matrons of hospitals by the Nurses Fund for Nurses the office of which is at 95 Dean Street W 1 This fund was started in 1925 and is managed by a representative committee of matrons and nurses all of whom give their services free At present, with great difficulty it is possible to grant about £65 a month to some fifty nurses, several of whom are now over the age of 80 small temporary emergency grants being made in desperate cases The fund also supports a home in South London where twelve old nurses live rent free Money is received in the form of collections from hospital staffs, individual nurses and other well wishers it is spent as it comes in there being no reserves and the only investment (about £1,800) forming the nucleus of the endowment. The accounts are audited and published annually A further £1 000 annually in subscriptions is needed and a sum of £2 500 to complete the endowment of the home Donations have been received from the Royal Family, several City Companies and the Corporation of London In a personal letter accompanying the appeal which is now being made Mr Norman Porritt consulting surgeon to Huddersfield Royal Infirmary stresses the great value of the work done with such small means and pleads for donations from hospital and private nurses as well as from medical practitioners who owe so much to the ministrations of nurses

Grenfell Association An Appeal

For some years it has been the practice of the Grenfell Association to issue a calendar and diary for sale on behalf of Sir Wilfred Grenfell s work in Labrador, and it is a matter for regret that in spite of so worthy a cause the publication has resulted in an increased loss to the association. Its place this year is being taken by specially designed Christmas cards, and we suggest to all those who send greeting cards to their friends at Christmas (and there are surely very few who do not) that they might remember this very deserving cause and purchase some at any rate from the Grenfell Association The cards are moderately priced—in boxes of six at 1s 1s 6d and 2s a box—and the designs include an etching of a Labrador dog team and a pen sketch by Sir Wilfred Grenfell They may be obtained, and also attractive gifts made by the people of Labrador and Newfoundland from the Grenfell Association, 66, Victoria Street S W 1

First Use of the Word "Insulin"

Dr ARTHUR EDWIN TAIT (London W) writes Sir Humphry Rolleston in the *British Medical Journal* of May 15, 1937 states that the hormone from the islands of Langerhans was named "insulin by Schäfer in 1916 It must be in the memory of many graduates of Edinburgh University as well as of my own, Schäfer saying in his lectures in Edinburgh in 1905 and before that date 'These islets contain an internal secretion insulin, which some of you present may, in due course, isolate

"Face saving"

"P R O ENGLISH writes In your issue of October 30 two prominent members of our profession are reported as using the Americanism facing up to (a difficulty) instead of the English phrase, facing (a difficulty) They are Lord Horder (*Journal* p 859) and Dr Dain (*Supplement* p 266) Am I right in holding that this usage is both unnecessary and incorrect, or am I being fussy?

On the Dunlop Rubber Company s stand at the Public Works, Roads, and Transport Exhibition to be held at the Agricultural Hall Upper Street Islington N from November 15 to 20 there will be specimens of the dunlopillo cushioning used for mattresses operating table pads and surgical and bed cushions Among the sports goods objects of topical interest will include gymnasium mats and medicine balls

conditions, and was notoriously dangerous In these circumstances he was puzzled by the *non possumus* attitude of a section of the medical profession towards this practice He could see no justification for their reluctance to denounce it in the strongest terms as wicked and criminal Some medical witnesses seemed to have a sneaking sympathy for the abortionist One, not in London had smilingly agreed with counsel for the defence that 'they all do it and there are not many failures Such an attitude would excuse the continued existence of a noxious sewer on the grounds that many people lived near it and that only a few died

Some speakers before the society had proposed to appoint psycho-analysts as medical advisers to criminal courts, to examine every person accused and if desirable, to treat every person convicted of crime Sir Travers Humphreys said that a court no more needed a psycho analyst than a lunacy expert Serious crime was not increasing, and the statistics indicated that the present methods of dealing with convicted persons were working satisfactorily Even the problem of juvenile delinquency was not one for medical experts Young people between 16 and 21 had been born during or just after the war Most of their offences could be explained by the slackening of home ties the absence of parental control, and the neglect of parents who habitually sought amusement and distraction in the evening Given a home where pleasure was the only god and discipline was unknown, what chance asked Sir Travers had the boy of withstanding temptation to steal, what hope was there for the chastity of the girl? In exceptional cases the courts made the most exhaustive inquiries A medical report was made upon any illness or injury suffered by the accused and no better psychologist could be found than an experienced prison doctor Any magistrate or judge could direct any examination psycho-analytical or otherwise which he considered necessary If any judge or justice found himself unable to administer justice in juvenile cases without a doctor at his elbow he was at liberty to resign his office in favour of a woman who had brought up a family of her own

MENTAL PATHOLOGY

The seventh general meeting of the Midland Mental Pathological Society was held in the Birmingham University on October 28 with the President, Sir GILBERT BARLING in the chair Dr F A PICKWORTH and Dr P BACSICH gave papers illustrated by lantern slides

Dr Pickworth's paper was 'A New Outlook on the Physiology and Pathology of Mental and Emotional States, and described a theory derived from the study of capillary irregularities in brains from mental hospital patients correlating such states with patterns of cerebral capillary mosaic each individual capillary controlling the function of groups of synapses and thus collectively behaviour Details of macroscopic vascular pathology and of the histo pathology revealed by the author's technique were described and illustrated

Dr Bacsich's paper was on Rapid and Simple Methods of Demonstrating Nissl Substance Myelin Sheaths and Nerve Fibres on Consecutive Sections of the Same Material the various steps of the processes were explained with a history of the evolution of the methods and illustrations of the value of their practical application

The quarterly meeting of the Association of Industrial Medical Officers was held in the London School of Hygiene and Tropical Medicine on October 22 At the business meeting the following office bearers were appointed for the year 1937–8 chairman Dr L P Lockhart (Boots Pure Drug Co) honorary secretary, Dr Donald Stewart (I C I Metals Ltd) honorary treasurer Dr Margaret Dobbie Bateman (Harrods Ltd) A paper was then read by Dr C Skinner (Thames Board Mills Co) on dental service in industry

ENGLAND AND WALES

National Tuberculosis Scheme

Sir Kingsley Wood, the Minister of Health speaking on October 20 at a reception given by the National Association for the Prevention of Tuberculosis, emphasized the importance of care work in the campaign against tuberculosis After paying a tribute to the association for its pioneer work and for its present work of education and propaganda coupled with the maintenance of a sanatorium colony for adolescent youths at Burrow Hill Surrey he said that the national tuberculosis scheme had its foundation in the years 1911 and 1912, and since then the tuberculosis death rate had fallen by more than half Factors which had contributed to this were first such general influences as the growth of better habits of living the removal of slums and the great housing measures undertaken since the war, and the increased protection of the milk supply, and secondly, the specific anti tuberculosis measures taken under the national tuberculosis scheme by the partnership of the State local authorities, and voluntary agencies As examples of the growth of the national scheme Sir Kingsley said that in 1911 there were some eighty tuberculosis dispensaries 1 400 beds in local authorities institutions and 4,200 beds in sanatoria provided by voluntary effort or privately owned To-day there were 480 tuberculosis dispensaries covering the whole of England and Wales while over 31 000 beds were available for the public treatment of tuberculosis, 155 000 persons (including 114 000 who were found not to be tuberculous) were examined at the dispensaries for the first time in 1936 and during that year 56 000 persons completed periods of treatment in residential institutions But to achieve full success the natural reluctance of persons who suspected that they were suffering from tuberculosis to have recourse to medical advice in good time must be overcome This necessitated the health education of the people, which the National Association had done so much to promote, and which he hoped would be carried yet further by the national health campaign just launched Tuberculosis was a problem which touched in a hundred and one ways both the individual and his family In many cases a patient and his family needed practical and often also psychological help This assistance constituted the tuberculosis care work and commonly the best means for giving it was a well organized care committee, drawing together the various benevolent agencies of the district and acting in close touch with the family doctor and the tuberculosis medical officer of the dispensary

The Tavistock Clinic

An appeal to industry to combat the prevalence of nervous disorders was made at British Medical Association House London on October 27 when the Duke of Kent presided over a meeting of industrialists organized by the Tavistock Clinic The specific purpose of the meeting was to ask industry to bear a substantial part of the cost of extending the clinic Sir Farquhar Buzzard said that one third of the sickness in this country was due to causes that were not organic A large number of the cases were preventable or curable, and that number would be increased if there were more doctors to deal with them Statistics showed that 1 in 14 of the working population suffered from nervous disorders to the extent of needing treatment and the loss to employers from this cause amounted to ten million weeks of working time each year Lord Hollenden honorary treasurer of the Tavistock Clinic said that the cost of providing accommodation for an adequate medical school hospital, and out patient department would be £300 000 plus an assured £20,000

diagnosis, and should be more widely practised The average duration of symptoms before admission to hospital was from four to eight months The results of the treatment were poor, twenty-five out of seventy-one patients died in the hospital, a further twenty were dead at the end of eight months, and of these ten died within three months No radical operation was performed, and no palliative procedure undertaken appeared to prolong life or to increase the comfort of the patient The necessity for a more accurate recording of each case-history with reference to the earliest symptoms is emphasized

364 Adrenalectomy in Arterial Hypertension

E DONZELOT and B MENETREL (*Arch Mal Cœur* August, 1937, p 553) describe and discuss two cases of arterial hypertension in which partial bilateral adrenalectomy was performed In both cases operative interference failed to lower the blood pressure for longer than a few weeks The authors point out that true permanent arterial hypertension is not a surgical condition, and they state that in the published cases of hypertension successfully dealt with by adrenalectomy analysis shows that a marked paroxysmal element was associated with the permanent hypertensive element They advocate this operation in cases showing sudden increases of blood pressure associated with pulmonary oedema, and in those suggesting the presence of a paraganglioma Operation has they believe, only a transitory and not a permanent effect on the paroxysmal element unless the hypertension is entirely due to an adrenal tumour In selected cases partial bilateral adrenalectomy is the method of choice The left suprarenal is usually removed first because it is anatomically easier of access Clinically it is impossible to diagnose a suprarenal tumour, and removal of the right suprarenal gland becomes a matter of course if the left is found to be healthy

365 Tuberculosis of the Tongue

From a clinical point of view M S BINSTOK (*Rev Laryng* July–August, 1937, p 745) divides cases of tuberculosis of the tongue into three groups The first includes patients with a positive sputum in which the tuberculous process is often localized near the tip of the tongue, or at the sides where carious teeth have caused slight abrasions The ulceration is superficial, spread is by continuity, and the progress of the lesions is relatively slow When associated with a chronic type of phthisis this form of tuberculosis of the tongue is very amenable to treatment by deep cauterization or local excision of the ulcers When the ulceration is deep with involvement of the lymphatic glands no surgical treatment should be attempted In these latter cases the best method of treatment is by x rays The second group consists of cases associated with a general dissemination of the tuberculous infection The lesions begin deep in the substance of the tongue, the infection being deposited there by one of the numerous arteries, the onset is usually sudden The tongue becomes swollen, but there is no ulceration for a long time, mastication and swallowing become extremely painful Surgical treatment is contraindicated, and only x rays and analgesics may be used If the general resistance is poor such lesions go on to deep ulceration If the resistance is good a tuberculoma of the tongue forms without ulceration The third group includes ulcerations near the lingual tonsil, which spread by the lymphatics Such lesions occur in phthisical patients who have undergone operations in the mouth and pharynx, such as tonsillectomy or partial excision of the glottis The few cases reported in the literature have been treated by applications of carbon dioxide snow, and section of the glossopharyngeal and superior laryngeal nerves to relieve pain Statistics show that cases of tuberculosis of the tongue form approximately 50 per cent of all the cases of tuberculosis of the mouth cavity

Therapeutics

366 Endocrine Treatment of Enlarged Prostate

E COMINELLI-GUARIGLIA (*Rinasc med*, August 15, 1937, p 520) states that hormones were first used in the treatment of retention of urine due to enlargement of the prostate by Van Cappellen in 1933, followed by Moskowicz, Verk, and Uebelhor, who obtained cures in 75 per cent of their cases These writers used testicular hormone only, but Freund showed that it was best to combine it with folliculin which has the property of stimulating and reinforcing the action of the male hormone, and more recently Ilic and Valerio have recorded brilliant results obtained by this combined treatment The present writer now reports ten cases of enlarged prostate treated by this method, of which four were cured, one was much improved, and the other five underwent suprapubic prostatectomy The cases undergoing operation, however, found the post-operative period much less trying than those who had not been treated with hormones The writer concludes that hormones cannot at present take the place of operation, despite the encouraging results so far achieved

367 Vaccine Prophylaxis of Whooping-cough

F MARTILLOTTI (*Pediatria* August 1, 1937, p 692) reviews the literature and records his observations on seventy seven children, aged from 1 month to 12 years, who were inoculated against whooping-cough during an epidemic in Naples in October, 1935 A mixed vaccine was employed consisting of a suspension of various strains of Bordet Gengou bacilli and other micro organisms, 1 c cm of the suspension containing 5 milliards of Bordet Gengou bacilli, 400 million *H influenzae*, and 200 million each of staphylococci, streptococci, pneumococci, and *M catarrhalis* Three doses varying from 1/2 to 1¼ c cm of the vaccine were given every other day No appreciable disturbance, either local or general, resulted from the use of the vaccine apart from a slight rise in temperature Forty-six of the children escaped infection entirely, and among the thirty-one who developed the disease the attack was short and uncomplicated, except for bronchopneumonia in two children who had had bronchitis before the onset of the whooping-cough

Dermatology

368 Radiotherapy of Chronic Eczema

According to S LOMHOLT (*Derm Wschr* September 25, 1937, p 1235) the main therapeutic task in chronic eczema is the alleviation of lichenization, keratinization, and the intolerable itching In such cases radiotherapy is often successful where medicinal treatment has failed *X* radiation of 80,000 to 90,000 volts is the most usual form of therapy, but Grenz-ray therapy is safer, as it can be applied repeatedly without danger to the skin For not too old nor too lichenified lesions the author prefers a thorium-x ointment The most active parts of this preparation are the α rays, which penetrate only slightly into the skin and therefore do not damage the deeper structures, but this method often causes pigmentation Better results are obtained by means of an emanation of radium therapy, whereby use is made mostly of the β rays The emanation is incorporated into wax, which is prepared in the form of plaques about 1 5 mm thick The radio activity of these plaques should correspond to about 0 02 to 0 06 millicurie per square centimetre These plaques are applied to the affected skin and left in position for a prescribed number of hours according to the strength of the emanation and the nature of the lesion The best

the body into line with the education of the mind any scheme in the universities must be superficial

NEED FOR INSTRUCTORS

Miss Helen Drummond principal of Dunfermline College of Hygiene and Physical Education said the success of the fitness campaign would depend on the provision of sufficient teachers and leaders and there was a possibility of the extension of the two training colleges in Scotland. Bailie A Gilzean, Edinburgh suggested that the difficulty of getting teachers of physical education was due to the expensive character of the training, which for a three years course at Dunfermline cost £300, and the average education committee was not prepared to grant this Professor E P Cathcart of the chair of physiology at Glasgow University said that much of the objection to physical training would disappear when it was clearly recognized that its aim was not to develop muscle-bound athletes but to produce general alertness and fitness of the whole individual Brawn and muscle were on the whole of less value than litheness and speed of action although it was through muscle training that they found the most accessible approach to training of the whole organism Mr W A Cochrane urged that the Advisory Council should seek the help of the medical profession in their campaign, and proposed the formation of a consultative body for this purpose.

Consumption of Sugar in Scotland

Dr J H P Paton St. Andrews, in an address at Cupar on October 27 stated that at the present time the people of Scotland consumed 100 lb of sugar per head per annum It was held that sugar was a necessity for the human race and essential to its welfare, but he did not agree with this view Sugar had not been heard of until the time of Alexander the Great The Romans and Greeks had reached their highest point of civilization without sugar and this substance was unknown in Europe in any quantity until about the seventh century The manufacture of sugar had been started about the fifteenth century in Venice The first cargo of sugar to reach England was brought in 1563 by Sir John Hawkins, together with the first potatoes introduced to this country Until recently the Eskimos had possessed no sugar and yet they were a perfectly healthy race An expedition to Tristan da Cunha reported that the islanders, although they had no sugar and no white flour were healthy, and there were no cases of diseased teeth A more recent report, however said that the introduction of sugar had led to a falling off in the standard of teeth since 1932 The increase in the use of sugar during the last hundred years had been colossal In 1840 the people of Scotland consumed 17 lb of sugar per head in 1850, 30 lb , in 1899 82 lb , and last year about 100 lb He had been disinclined to believe this at first but examining the food at a girls school he had found that excluding sweets and tinned fruits each girl consumed 2 lb of sugar every week He had noted over a period of twenty-five years the incidence of catarrhal illness in this school and that during the war years when sugar was not available to the same extent, there was a considerable drop in this type of illness It was probable also that the increased death rate from diabetes was due to sugar

Aberdeen Maternity Hospital

A new maternity hospital at Aberdeen which forms part of the group of buildings included in the Aberdeen joint hospitals scheme at Forresterhill was opened on October 29 by Mrs J A Ross vice-chairman of the hospital Mr Norman Leslie chairman of the Board of Directors said that in 1893 a house in Barnett s Close had been rented by the managers of the Royal Infirmary for lying in patients and £250 had been spent on equipping and fitting it. In 1900 new premises had been taken in Castle Terrace and in 1912 it was decided that the administrative and financial association of the maternity hospital should be severed from the Royal Infirmary From that date the hospital had carried on its work as an independent unit, but the directors felt that a building more commensurate in size with the needs of the community should be erected, and during the past few years appeals had been made for donations to a building fund Very liberal contributions had been made by Mr and Mrs J A Ross and by the late Dr J E Crombie and without this help the hospital could not have been realized The hospital, designed to hold thirty-four patients, had been equipped in the most modern manner, but a sum of £10 000 was still required to put it on a sound financial footing Mrs Ross in declaring the hospital open said that they had been looking forward for many years to the time when Aberdeen would have a maternity hospital worthy of the city and she believed that their hopes had now been realized

Royal Glasgow Asylum for the Blind

The new extension of the Possilpark Branch of the Royal Glasgow Asylum for the Blind was opened by Mr Walter Elliot M P The treasurer said that the joint committee for the south-west of Scotland was a pioneer organization in regional government, for it represented twenty local authorities and had been in operation since 1922 It had worked harmoniously and there had been no serious division regarding administration in the past ten years Such community of thought and interest was a hopeful augury for regional administration in the future The newly opened workshops for the blind were the largest and most up to date in Great Britain with provision for 500 workers They had been erected without cost to the ratepayers from £15 000 derived from the sale of the old premises in Castle Street to the Royal Infirmary Mr Walter Elliot, in declaring the workshops open paid a tribute to the successful co-operation between local authorities and voluntary workers He said the Government intended at an early date to introduce legislation reducing the pension age of blind persons from 50 to 40 years Expenditure on the welfare of the blind in Scotland was now over £300 000 yearly, and of that sum £200,000 was contributed by the State and local authorities

IRELAND

Royal Academy of Medicine

At the annual general meeting of the Royal Academy of Medicine in Ireland held on October 4, Dr A. R Parsons was elected president and Dr T P C Kirkpatrick was re-elected general secretary The following were elected presidents of Sections Dr Edward T Freeman Medical Section , Dr G C Dockeray Pathological Section Mr A. A McConnell, Surgical Section Professor J Kay Jamieson Section of Anatomy and Physiology Dr C J McSweeney Section of State Medicine Dr J S Quin Obstetrical Section Mr T O Graham Section of Laryngology and Otology

The Voluntary Hospital System

Dr Douglas Boyd honorary radiologist to the Mater Infirmorum Hospital Belfast in his address at the opening of the winter session on October 20 reviewed the whole system of treatment of the sick to-day criticizing particularly the crowded out-patient departments of hospitals and insurance practitioners surgeries Of the voluntary hospitals he said that these institutions built for the necessitous poor were crowded to the doors by the insured patient sent there because the panel doctor was too busy to look after him, by the national health insurance patient sent for legitimate consultation and by the middle-class patient who could not afford the cost of treatment elsewhere More extensive and expensive examinations meant more hospitalization and fewer private consultations The breakdown of the voluntary hospital system would be

uterus affecting both cervix and body is occasionally met with, and whether arising in the cervix or the body of the uterus is not likely to respond to *x*-ray or radium therapy

374 "Accouchement Force"

C HOLTERMANN (*Zbl Gynäk* August 28, 1937, p 2063) advises the admission to hospital of every case of placenta praevia, and discusses the difficulties in treating infected cases In selected cases he recommends *accouchement force* by Delmas s method First described in 1928, this consists in full manual dilatation of the cervix, followed by vaginal delivery under low spinal anaesthesia It has been advocated in France, Spain, and Italy, but has been little used in Germany, where the evil results of *accouchement force* during the nineteenth century are well remembered Holtermann's indications for Delmas s delivery are less wide than those of its author, he confines it to cases in which Caesarean section is contraindicated, and has used it without maternal mortality in six infected cases of placenta praevia, as well as in one of septic pyelitis and one of premature placental detachment One only of the five foetuses weighing over 1 5 kg died, and death took place a few hours after birth from a cause unexplained at necropsy Among the advantages of this method are slight or absent haemorrhage and shock, good response of the uterus to stimulants, and diminution of the danger of abdominal infection Among the disadvantages are a fall of blood pressure and the risk of tears The latter diminishes with the operator's increasing experience *Accouchement forcé* without lumbar anaesthesia Holtermann holds to be unjustifiable except in the most exceptional cases Nevertheless he has performed it successfully in a patient apparently moribund from haemorrhage, and in a multipara with partial placenta praevia and prolapse of the cord The contraindications are (1) those, either local or general, of spinal anaesthesia itself, (2) *foeto-pelvic disproportion*, (3) cervical scars, rigid cervix, or previous uterine incisions, and (4) pregnancy which has not attained the last month

375 Metrorrhagia of Puberty

F P DONEDDU (*Ann Ostet Ginec* July 31, 1937, p 787) describes sixteen cases of metrorrhagia of puberty successfully treated by thirty to forty daily intragluteal injections of about 10 to 20 c cm of the patient's own blood taken from the arm The usual anti-anaemic medication was employed at the same time The reasons for the success of autohaemotherapeutic treatment are discussed, and it is concluded that it acts partly by disturbing colloidoclasic equilibrium and partly by inducing modifications in the neuro-vegetative nervous system and the endocrine balance

Pathology

376 Glycerol Extract of Suprarenal Cortex

F A HARTMAN G W THORN and R R DURANT (*Endocrinology* July, 1937, p 516) report the results of treating cases of suprarenal insufficiency with a glycerol extract of suprarenal cortex from which the adrenalin had been almost completely removed and which was of such concentration that 1 c cm of the extract corresponded to 1 5 grammes of cortex The advantages claimed for this extract are that it is less expensive than purified aqueous cortin, that glycerol is a good preservative and solvent of cortin and that it can be given orally The amount that can be administered is limited by the patient's tolerance for glycerol The usual dosage was from 2 to 4 c cm three times a day taken after food and followed by water, but as much as 20 c cm per day has been given In nine cases of severe Addison s disease an attempt was made to substitute the glycerol extract for cortin injections, three cases are reported in detail The authors conclude that glycerol extract therapy in Addison s disease should only be attempted when the patient s requirement is small For a time glycerol extract may maintain a severe case under most favourable circumstances, but it will not compensate for strenuous activity or injury Cases with less severe symptoms or early cases of Addison s disease may respond so well to glycerol extract therapy that under continued treatment they return to normal activity Glycerol-extract is also useful in the diagnosis and treatment of patients in whom two or more classical findings of Addison s disease are present with other symptoms which make the diagnosis doubtful The symptomatic response in six such patients was good

377 Blood Dust

A C FRAZER and H C STEWART (*J Physiol* June, 1937, p 18) report investigations into the variations which may occur in the ultramicroscopic picture of normal human serum Dull, large particles and small, bright particles were seen under dark-ground illumination The numbers in each field were compared under different conditions During fasting the numbers fell to a basic level which was maintained with only small fluctuations for periods of up to one week After a normal meal there was a marked rise in particle counts after one hour, maximum values being obtained after two to three hours, and a return to the initial values following in four to five hours Similar variations were noted after each meal throughout the day Pure carbohydrate or pure protein meals failed to cause any increase in the particle count, there might even be a decrease after a pure carbohydrate meal Fats administered by means of a duodenal tube produced a marked increase in particle counts starting about fifty minutes after ingestion After a mixed meal the blood fat content and the particle count of the serum followed a parallel course The particle count after the ingestion of food was found to show an initial and a delayed rise The initial rise was small, occurred immediately after the ingestion of food, and was followed by a fall before the delayed rise It was independent of the type of meal given and was also produced by aperients It is attributed to the absorption of previously ingested fat under the stimulus of intestinal movements The delayed rise did not appear until one hour after the ingestion of food, it was greater in size and duration than the initial rise, and only followed fatty meals It is attributed to the absorption of recently ingested fat The particles were observed in circulating and freshly shed blood and they did not increase in numbers on keeping the serum The authors conclude that the particles studied are normal constituents of circulating blood and consist mainly of fat, probably enclosed in an adsorbed protein film

378 Uterine Changes due to Folliculin

G GARUFI (*Arch Ostet Ginec*, May–June, 1937, p 189) confirms the finding that in infantile or mature castrated rats proliferative changes in the uterus follow repeated administrations of folliculin in large doses He used progynon-B oleosum for up to thirty days, and found that the increase in size affected the myometrium as well as the endometrium The epithelium remained cylindrical, often in several layers Although superficially resembling glandulocystic endometrial hyperplasia in human subjects from unduly active follicular secretion, the endometrium in no case showed true glandular function with the production of mucin or glycogen Two out of six infantile, and seven out of fourteen mature, animals had endometrial islets of squamous epithelium, without any suggestion however of malignancy No syncytial formation occurred About one-third of the animals showed an aseptic pyometra

cases the treatment was interrupted, in one by an attack of acute cholecystitis and in the other by acute mania in a hemiplegic subject The patients were of a poor quality, the majority being between 60 and 70 years, three were under 50 and three were over 80—the eldest 95 There were a number with complications of diabetes, nephritis myocarditis, and the like Yet there were no deaths, and in every case there was bony union of the fracture

Dr Kleinberg remarks on the life saving quality of the abduction treatment, feeling sure that under the old conditions a large proportion of the patients would have died from infected bedsores, exhaustion, and bronchopneumonia.

The routine of treatment may be sketched The abduction method was applied as usual under anaesthesia but with trained assistants Only about fifteen minutes was required for the application of the treatment After a few days the patient was placed in the upright posture, and at intervals weight was borne As soon as feasible crutches were supplied and locomotion encouraged As a rule the patients were discharged from the hospital in two weeks The long spica was retained for two months it was then replaced by a short spica, permitting motion at the knee Six weeks later a canvas support was substituted to permit movement in the joint

Dr Kleinberg concludes that weight-bearing on the protected fracture stimulates repair since it was usually well advanced in two months He also reports on ten other cases treated in the same manner by a colleague Of these six were transcervical, and in all bony union was attained Thus in sixteen consecutive cases of transcervical fracture this result was achieved

I have elsewhere suggested that there were certain disadvantages of the spiking operation—for example, that the fragile cortex of the elderly subject might give way under the leverage of the nail and that it was doubtful if spiking would always restrain the tendency toward flexion and adduction of the limb so characteristic of injury or disease of the joint Further, that an intramedullary metal splint must lessen the nutritive capacity of the cancellous tissue Finally that in the event of disintegration of the apposing surfaces of the fragments—a not unusual preliminary to repair—they would be held apart by the means designed to appose them

It will appear from this report that the period of complete disability in these cases of fracture of the neck of the femur was actually much shorter than that required for the treatment of fracture of the shaft in young subjects and that Dr Kleinberg's suggestion disposes of one of the chief objections to the abduction method —I am etc,

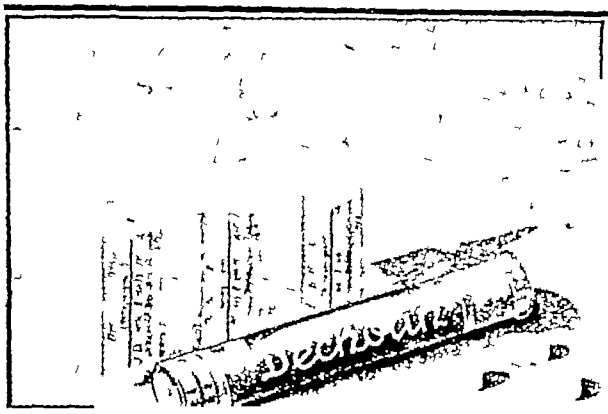
ROYAL WHITMAN

Treatment of Cancer of Breast

SIR —No one can read Mr Geoffrey Keynes's article on conservative treatment of cancer of the breast (*Journal*, October 2, p 643) without great interest and admiration for the results obtained, yet I would like to point out that while he has counted his "gains on the roundabouts" he has ignored his "losses on the swings"

For statistical purposes he has divided his cases into three groups (1) disease apparently confined to the breast (2) disease apparently confined to the breast and axilla (3) disease advanced or inoperable And he has explained that many of his Group 1 cases really belonged to Group 2 because carcinomatous axillary lymph glands cannot always be appreciated clinically Continuing the argument, the results of his Group 2 cases (disease apparently confined to the breast and axilla), which are slightly below those of surgical excision, are weighted heavily in favour of radium treatment, for there are many cases where enlarged axillary glands can be appreciated clinically and following radical amputation of the breast are found pathologically to be only chronic inflammatory glands Therefore Group 2 in this series must consist of a mixture of Group 1 and Group 2 cases, and, making the necessary correction in Group 2, it can be seen that the results of radium irradiation of the axilla are considerably below those obtained by surgical excision

With this in view I have examined 607 cases treated at the London Hospital by radical amputation Of these, in sixty six cases the information in the notes is incomplete in 274 cases no enlarged glands were reported clinically, yet, of these 125 cases had carcinomatous glands 105 chronic inflammatory changes, and in forty four no adenopathy was reported In the remaining 267 cases in which axillary glands were reported as being clinically enlarged, sixty three subsequently were found to have only chronically inflamed glands Having made the correction in Group 2, I think it can be appreciated that the survival rate of interstitial radium irradiation of the axilla is not better but worse than that of surgical excision —I am, etc,



London E.1 Oct 26 HENRY R THOMPSON

Treatment of Spastic Paralysis

SIR,—Dr F H Mills's statement in his paper on the treatment of spastic paralysis (*Journal* August 28 p 414) that ramisectomy has now no part in the treatment of spastic paralysis calls for comment In the first place, the operation is called sympathetic ramisection and has been since the first paper was published in 1924 In the second place, Hinsey did not discover in 1934 that the sympathetic nerves did not supply voluntary muscles —Wilkinson produced evidence of this in 1929 (*Medical Journal of Australia* November 30, 1929) The published results of Wade (president of the Royal Alexandra Hospital for Children, Sydney, Past President of the Royal Australasian College of Surgeons) Poate (senior surgeon, Royal Prince Alfred Hospital Sydney) the late Von Lachum (of the New York Orthopaedic Hospital) Robertson (surgeon Toronto Children's Hospital) Stewart (surgeon, Los Angeles Children's Hospital) Carell and others refute the statement that sympathetic ramisection has no part in the treatment of spastic paralysis

Sympathetic ramisection does not depend on the double innervation of skeletal muscle for I have lately produced evidence that sympathetic ramisection alters the blood supply of the spinal cord in that it increases the rate of capillary flow (*Medical Journal of Australia* June 26 1937) This necessarily decreases the rate of oxygen absorption and thus the activity of the spinal cells I have never seen sympathetic ramisection produce retention of urine or other disturbances of micturition—except diminution of frequency—and my experiences extend over hundreds of patients

With regard to the cases quoted by Dr Mills none, except the last, is a typical spastic case and that did not improve very much Since Dr Mills did not graduate till 1933, and he was a resident medical officer at Royal Prince Alfred Hospital during 1934, it is evident that he had to rely on Sister Kenny for some of the records of patients or on his own judgement for the results of treatment Sister Kenny admits having had no training in anatomy or physiology

ECZEMA

Relief and cure with Peat ointment.

Because eczema generally brings pain and itching, any local dressing should attempt soothing as well as healing And this is the great virtue of Sphagnol peat ointment — that from its first touch, it gives coolness and comfort to tender skin

Many doctors find Sphagnol so successful that they are prompted to write about it. Here is an extract from one of the letters we have received

"Thank you for the ointment I have tried it on an incipient case of local eczematous trouble and found it to give great relief and to arrest the manifestation" — Signed (Dr) R L.

Test Sphagnol personally On receipt of a postcard we shall be pleased to send you a sufficient supply

Toxæmias of Faulty Metabolism

SALVITAE enables the physician to control elimination and alkalinization, thus dealing fundamentally and effectively with the Toxæmias of Faulty Metabolism

SALVITAE

SALVITAE increases the alkalinity of the blood and tissues prevents the over production of nitrogenized materials Improves oxidation and stimulates the natural activity of the eliminative organs

Professional samples and literature gladly sent on request.

COATES & COOPER LTD, 94 CLERKENWELL RD, LONDON, E C 1

the Services is also taken account of in the population estimates and in mortality records, and it has an appreciable effect on the sex ratio at certain ages

Examination of the sex proportions at each Census since 1841 reveals a sudden depression in the male to female ratio at ages 20–24 compared with the preceding age group, this being due partly to the above-mentioned factor and partly to the excess of male over female civilian emigration among young adults, but the reversal since 1930 to an inward balance of migration has for the present removed the latter cause of depletion of the population of young adult males —I am, etc,

General Register Office Somerset House, London W C.2, Oct 25 PERCY STOCKS

SIR,—The determination of sex and regulation of ratio were fascinating centres of argument among the learned and unlearned alike long before statistics were invoked to show the relative constancy Moreover, the differences in and causes of secondary qualities of sex have general interest psychologically—the effeminate male and mannish woman reaching the extreme in homosexuality, regarded in some countries as a developmental malady and by others as a criminal offence One European country at least views homosexuality in both sexes as a crime—France neither, while England stands midway, with Lesbianism socially banned

From our medical angle biology can well be taken into account when directing our attitude toward these perversions Sex ratio and viability studied in the light of Mendelism, with its genes and chromosomes having a demonstrable existence leaves less ground for theoretical speculation Professor Julian Huxley's *Essays in Popular Science* deprive many of the processes concerned in development of some of their mystery by biochemical explanation and places them on a scientific and rational basis It is not necessary to commit to memory all the intricate details of observation and experiment but the knowledge of their existence breeds humility and, as Dr A. Mahony-Jones says (*Journal* October 23, p 828), makes us recognize 'that the subject is full of pitfalls'—I am etc,

Southampton Oct 24 ARTHUR KING

Adult Whole Blood in Measles

SIR —I had several occasions to use whole parental blood to protect children during a large epidemic of measles in a poor district of Lancashire during the spring of 1936 I was pleasantly surprised by its efficacy, which corresponds with that described by Dr Grogono Actually it is the method advocated by W H Park of New York, and I see that it is mentioned in the last edition of Conybeare's textbook of medicine Dr Grogono and I used 8 to 10 c cm instead of the 30 to 60 c cm recommended by Park, and I think that anyone would hesitate to inject as large a bulk as 60 c cm into the buttocks of a small child particularly in view of the efficacy of 8 to 10 c cm

I think the dangers attendant on this method are perhaps less than set out by Dr Grogono A positive Wassermann reaction does not necessarily imply the presence of spirochaetes in the blood stream Many adults seem to be immune to measles although they have never contracted the disease in its usual form, and the parallel holds in other febrile conditions Naturally immunizing with parental blood where there is a definite history of measles is to be preferred, but the absence of such a history does not appear to negative the therapeutic result —I am etc.,

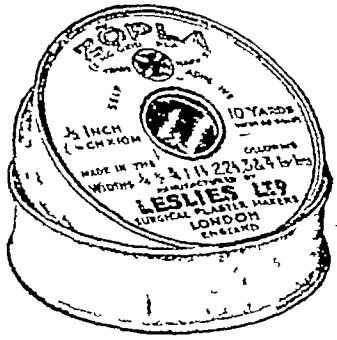
Shrewsbury Oct. 31 J G C SPENCER M.D

Adult Serum in Measles

SIR —I have been using this method in a few cases where babies had to be protected from the infection brought back from school by an elder child I use a 30 c cm venule to draw off the blood from a parent or elder child, and next day this gives 12 to 15 c cm of serum An injection of 5 c cm will usually make the attack a mild one, and sometimes prevents it altogether I regard as modified an attack in which the temperature does not exceed 100 F and the rash fades on the day of its appearance Usually I do not see the patient till the rash has appeared One of the parents comes to the surgery that night to have the blood taken, and the separated serum is injected next morning—that is, about the fourth or fifth day of incubation I should like to emphasize that the whole treatment is quite easy and not expensive a venule only costs 2s I have no statistics to give but my impression is that well over three-quarters of the children treated have modified attacks —I am, etc,

King's Langley, Oct 31 REGINALD FISHER

Risks of Anaesthesia



SIR —Dr M D Nosworthy, in his article on the risks of anaesthesia (*Journal* October 23, p 809), says that the signs of toxicity due to carbon dioxide are a fall in blood pressure, depressed or gasping breathing, and muscular twitchings, which may pass on to generalized convulsions and death" I would like to know if Dr Nosworthy has ever seen these muscular twitchings when no ether has been given Having often encountered this condition when accelerating an ether induction with carbon dioxide—for instance when a long hospital list has to be worked through in a short time—I have come to regard this phenomenon as a form of early ether convulsions brought on by excess of carbon dioxide Fortunately, these minor convulsions are always quickly aborted by the administration of pure oxygen and the avoidance of rebreathing, and if one then increases the ether vapour slowly a good anaesthesia is eventually obtained with no further signs of convulsions

The similarity to late ether convulsions is unmistakable, and in my own cases the earliest noticeable twitching has always been about the eyelids, especially the lower lid towards the inner canthus I am sure that the mere rapidity with which an ether anaesthesia is induced also plays a part, because the most certain way of bringing on those early twitchings is to turn a Boyle's ether bottle full on after the patient has been intubated under nitrous oxide anaesthesia —I am, etc,

Spinal Anaesthesia for Caesarean Section

SIR —In the years 1930 and 1931 I did fourteen classical Caesarean sections under spinal anaesthesia Spinocain and ephedrine were used with premedication of 1/100 grain of hyoscine three-quarters of an hour before operation In one case I had an experience similar to Mr H A Kidd's but fortunately the patient recovered Immediately following the spinal injection, which was made without any difficulty, there was an alarming drop in the blood pressure, the systolic pressure falling to below 60 The patient became grey and had air-hunger, and I thought she was about to die A further injection of ephedrine was made and another of 10 units of pituitary extract Within ten minutes the blood pressure had risen to above 100 again and the patient's colour had become normal I then had to perform the operation, which I

see them come in said a farmer—that perhaps you will print the recipe in a footnote [1]

3 *Maslin cakes* These are similar to the wheaten cakes in preparation except that about a sixth of the grain used is rye Maslin is an old English word for a mixture of wheat and rye Modern farmers sometimes *grow* them together so that the stiff rye straw may hold up the weaker wheat Modern mills can easily separate the grains, but in the Middle Ages they were ground together and maslin bread was a staple Rye gives fewer calories than wheat, and for that reason forms of bread containing it have become popular with those who wish to be slim, and though it is poorer in vitamins, its pleasant taste suggests the presence of other minerals than wheat has

Small scale milling, that is the keynote surely of the use of whole meal The germ oil once rubbed into the endosperm or flour soon, in a few days, deteriorates it I do not think that, to misquote Dr Stallybrass, a person desiring brown bread with its appropriate complement of vitamins could *ever* get it milled in accordance with *any* prescription if that means flour which will keep The batch ' bread of our forefathers was *their* solution The farmer would throw half a bag of wheat across the withers of his horse and canter down to the mill, he would take it back as flour and there and then bake his batch—and was it not good, drawn from the oven heated with thorn or ash!—and the batch would last the household a fortnight when it was time for the next grinding

The introduction of the steel roller mill from America in 1872 was the beginning of the end of all this Think of it! The first operation of that mill strips the grain of its coat and shirt (bran and aleurone layers) and of its purse of money (the embryo and germ) and leaves the poor white body naked White flour results, without a single + sign to its name in the vitamin schedule What wonder that we spend millions on patent aperients when all the B_1 and B_2 are removed Still more serious, what wonder that since that date appendicitis gradually took its rise—surely surgical recognition is not the only explanation of its ascending prevalence Finally, it is since that date—the date on which the wheat-germ oil, the richest known source of fertility of vitamin E began to be totally eliminated from bread—that the birth rate began to check gradually and then to fall, till it reached the steep place of recent years There has been much solemn consideration of this matter, as well there may be but here is a factor which though subtle may well be fundamental—I am, etc,

Holmes Chapel Oct 31 LIONEL JAS PICTON

Early Diagnosis of Pregnancy

SIR—From time to time in both American and European medical and scientific journals I have seen articles, comments and letters on the chemical or biological diagnosis of pregnancy There seems however to be an almost universal ignorance of the method in vogue in South Africa For almost five years we have employed frogs (*Xenopus laevis*) with excellent results The method was described in *Nature* (1934 **133** 494) and in the *South African Medical Journal* (1935 **9**, 202) To me it seems ludicrous to describe chemical and biological tests which do not give results comparable with those obtained with these frogs The method is 100 per cent. accurate when it is positive, and 98 per cent accurate when it is negative D Zwarenstein and I have given a wrong diagnosis in only six out of 1,000 tests Moreover the test can be completed in twelve hours or less, and in no case does it take more than twenty four hours There is thus no reason for Dr Jocelyn Patterson (*British Medical Journal* September 11) to state that ' the most rapid of the biological tests takes twenty four hours I venture to suggest that none of the tests at present employed is as satisfactory as the frog test Furthermore, an improvement in accuracy is well-nigh impossible The only drawback to this test is that the South African clawed frog is indigenous to South Africa and does not flourish in the northern hemisphere—I am etc,

Capetown October 18 LOUIS P BOSMAN

*** Reference was also made to this test in an article by Professor F A E Crew (*British Medical Journal*, 1936, **2**, 1092)—ED *B.M.J*

Apparatus for Continuous Suction

SIR—I do not think Mr Stewart Gourlay (*Journal* October 23, p 829) has solved all the defects of the Bunsen type of aspiration pump The great advantage is reliability, but the main disadvantage is lack of mobility I do not approve of one suction apparatus of any type, supplying six beds because it is impossible to lay on pressure at a low suction rate It would be possible to have six closed-drainage empyema cases aspirated by the same machine, but for six suprapubic cystotomy cases a high pressure in the tube would be required to carry over clots Such a pressure would not be developed if five out of the six cases were merely aspirating a mixture of air and urine—I am etc,

Liverpool Oct 23 M J BENNETT JONES

Abscess of Lung

SIR—With reference to Dr L S T Burrell's interesting paper on lung abscesses and their treatment in the *Journal* of October 23 (p 789) I would like to point out that the short wave therapy of this condition has given remarkable cures in a considerable number of cases within the last few years I have seen myself a few patients with one or more lung abscesses make a complete recovery within five to eight weeks some of these patients had been previously treated unsuccessfully along the usual medical lines with postural treatment expectorants, and various intravenous injections and were far too ill for any surgical measures The aetiology and bacteriology varied in these cases but the majority of those which I saw were cases of multiple abscesses situated in the upper fields several were post pneumonic

The patients to whom I refer were treated by Professor E Schliephake who later dealt in detail with these and subsequent cases in a paper published in the *Medizinische Klinik* (1936 **32**, 380) in which he also refers to the equally good results published by Liebesny of Vienna and by Fiandaca Schliephake had only one fatality amongst at least fifteen patients while the others were completely cured with the exception of one patient in whom an abscess complicated a bronchiectasis which latter, although improved, persisted after the treatment had been discontinued The diagnosis of the existence of one or several abscesses before beginning treatment and the clinical evidence of their complete disappearance, with

[1] Fresh whole meal 3 lb Salt 1 to 2 teaspoonfuls (tastes differ) Baking powder 2 teaspoonfuls Beef dripping 3 dessertspoonfuls (lard produces a quite palatable but quite different biscuit) Milk and water enough to make it into a thick paste Roll out very thin Experience shows that finely ground flour should be used to dust the board and pin Stamp out into biscuits and bake on the oven bottom or on a greased bakestone or frying pan Store them in a tin When serving them put them in a toast rack in the oven for a few minutes so that they shall be very crisp To be eaten with or without butter

The advantages of the Curtis Abdominal Support No 1 lie in its anterior - posterior pressure By this method the lower abdomen is effectively supported while the hips are given complete freedom of movement This, combined with its scientific design and extreme lightness in weight, makes the Curtis-Abdominal Support No 1 the most efficient and comfortable on the market

Obituary

J S MANSON M D

Late Visiting Surgeon Warrington Infirmary

As briefly announced in last week's *Journal* Dr J S Manson died on October 24 in the Warrington Infirmary nursing home He had not been well for some time before admission, but was anxious to attend the Annual Panel Conference in London

John Sinclair Manson was born in 1873 of Caithness parents living in Glasgow After schooldays at Robert Gordon's College, Aberdeen, he went to sea as an apprentice in the City Line in 1888 and served both in sailing ships and steamships, gaining his master's and extra master's certificate by 1901 In that year he began his medical course at Edinburgh graduating M.B, Ch B in 1906, then after acting as house surgeon at the Oldham Royal Infirmary, he started practice in 1908 in Warrington, and was a member of the out patient visiting staff of the Infirmary for fifteen years He took the D.P.H of Manchester in 1910 and the M D of Edinburgh in 1913 For the past thirteen years he had been medical officer of health for the Runcorn rural district

Dr Manson joined the British Medical Association in 1911, and after a short period as acting honorary secretary of the Warrington Division was elected its chairman in 1925 He was representative of the Division at the Annual Meeting in 1923 and continuously since 1931 In 1933–4 he was president of the Lancashire and Cheshire Branch At headquarters in London he was a member of the Psycho Analysis Committee in 1926–9, of the Health of Merchant Seamen Subcommittee in 1920, and of the Mental Deficiency Committee in 1930–2 He served on the Medico Political Committee for the past eight years, and on the Central Council of the Association since 1935

Apart from his deep and active interest in medical politics and medical sociology Manson's versatile mind found many outlets He was at various times secretary, member of council, and president of the Warrington Literary and Philosophical Society a member of the Warrington Field Club and chairman of the local Archaeological Society He was also a member of the British Institute of Philosophy and of the British Association for the Advancement of Science and a past-president of the Caledonian Association The study of genetics particularly appealed to him and he contributed a number of papers on hereditary diseases to the *Lancet* the *Transactions of the Ophthalmological Society* the *Journal of Genetics* and the *British Medical Journal* In 1927 he was awarded the Sir Charles Hastings Prize by the Council of the British Medical Association for his essay Observations on Human Heredity

Dr C O Hawthorne writes

May I be allowed to pay a brief tribute to the work and memory of the late Dr J S Manson? In his Branch and Division Manson showed from the beginning the readiness for service which disdains no duty and it was by right of ability and of achievement that he rose to influence and to leadership Called by his colleagues to secretarial and presidential responsibilities he acquitted himself with distinction and was recognized and appreciated alike in professional and in civic life Both here and in the larger field of the Representative Meeting he not infrequently presented a point of view marked by independence and sometimes by originality and though he did not always persuade the majority, his sincerity and courage commanded general respect and goodwill while for himself he cultivated in all circumstances the solace of the equal mind With his recent election to the Council a still wider opportunity seemed to offer itself but this unfortunately Fate has too quickly closed

Above all other convictions Manson was an enthusiastic believer in the responsibilities and opportunities of general practice And these he used to good purpose, both as the guiding friend of his patients and also as a scientific student and observer Particularly was he interested in questions related to heredity, and it was one of his studies in this subject which won for him in 1927 the Sir Charles Hastings Prize and later appeared as a chapter in his 'Observations on Human Heredity Here, as well as in many individual clinical studies—one published only a few weeks ago—Manson fully established his position as a careful observer and acute reasoner as well as a serious student of current literature and work In many directions he enjoyed not only a busy life but also a life rich in service and interest, and while medicine claimed him as a loyal disciple, he had more than a passing affection for the philosophies and for public affairs the meetings of the British Association and of the Philosophical Society knew him well Though firm and independent in his opinions Manson was gentle both in thought and manner, and for those of us who knew him well he leaves grateful memories of good comradeship and of much pleasant discourse

Dr Peter Macdonald writes

It was with the very greatest regret that I found on opening my copy of the *Journal* this morning your announcement of the death of J S Manson of Warrington I first became really acquainted with him when we were both members of the Psycho Analysis Committee, and I well remember the delight with which I recognized that I had found a new friend in a quarter in which I did not anticipate it with a most attractive personality a cultured mind and a singularly gentle spirit We remained friends thereafter and though I and also others have differed from him medico politically we always respected his motives and were always pleased by the language in which he set forth his case Our Association will be poorer for his absence and there are none of his colleagues who will not mourn his loss

Dr G A Sinclair writes

While the death of Dr Manson is a loss to the B M A to us his colleagues in Warrington, it is a calamity Dr Manson lived for his work he was the friend to whom all his colleagues turned on matters medical whether of ethical or political significance In any local medical problems Dr Manson's advice was always sought and the result was always the same—a wise solution agreeable to all During his thirty years as a general practitioner in Warrington he found time to attain many distinctions of a scholastic type From 1909 to 1924 he was attached to the staff of the Warrington Infirmary as home-visiting physician For many years he was honorary secretary to the Warrington Local Medical and Panel Committee, was a member of the Lancashire and Cheshire Branch Council and had held office as president of the Branch In addition to his medical interests he was a past president of various local societies and his interest in the British Association annual meetings was similar to his interest in those of the B M.A.

Mild Constipation shown to yield to laxative effect of HOVIS

Many of the mild forms of constipation so prevalent to-day are attributed to the consumption of foods deficient in Vitamin 'B' In comparing the effects of various kinds of bread it is seen that HOVIS germ bread is superior to either white bread or wholemeal in supplying this deficiency

Whilst white bread contains practically no Vitamin B,' HOVIS, with its added proportion of 25% wheat-germ, supplies an abundance of this essential food-element Unlike wholemeal bread, HOVIS contains only a minute percentage of bran and indigestible cellulose. In other words its incorporation in the normal diet ensures not only a higher standard of nutrition but easier assimilation and regular evacuation of the intestinal contents

VITAMIN 'B' CONTENT ACTS AS AID TO REGULARITY

Entering the R A M C as lieutenant on January 28 1899 he became lieutenant-colonel in the long promotion list of March 1 1915 and colonel on December 26 1923 retiring on December 26 1927 He served in the South African War in 1900-2 when he took part in operations in the Orange Free State including the actions at Paardeberg, Poplar Grove Karee Siding, Vet River and Zand River and in the Transvaal including actions at Johannesburg, Pretoria and Diamond Hill receiving the Queen's medal with four clasps and the King's medal with two clasps He also served throughout the war of 1914-18 and in 1918-19 was A D M S of the 17th Division in France and Flanders receiving the medals and the C B E. Since his retirement he had been employed at Chiseldon

Universities and Colleges

housing. He said that in the House naturally and rightly they frequently heard of cases of great distress in one respect or another It was a pity that they were inclined to deduce therefrom the idea that it was necessary to legislate instead of simply administering more closely the powers that existed He was inclined to think that was so in regard to the distressing cases they heard of constantly in the matter of pensions Medical opinion was naturally always in favour of the patient He had cases again and again from his own constituency and elsewhere and his own inclination was always in favour of the applicant being granted some further help When they had brought these cases before the Ministry of Pensions he had naturally been in a privileged position, being able from a professional point of view to go into the technical side of matters It was quite true that many of these people came forward armed with opinions from specialists giving their definite view that the complaint in respect of which application was made to the Ministry was really due to war service though it had arisen after very many years. His own conclusion was that there were no specialists in this matter equal to those of the Ministry of Pensions They were an extraordinarily able set of men who had been devoted to this extremely difficult problem of deciding many years afterwards to what extent one could trace an illness or a lesion to an injury suffered twenty years before or to what extent it had been exaggerated by that injury It was a special department of the profession and he would trust the word of the Ministry s specialists above that of any outside specialist however eminent in his own private practice Those officers had no reason for not letting the balance turn in favour of the applicant.

Passing to the question of housing, he said the report on rural housing by a subcommittee of the Central Housing Advisory Committee of the Ministry of Health recently published dealt most thoroughly with the whole subject. The subcommittee had given a definite line to the Government for action Referring to diet and to the provision of meals and milk he said that we wanted to see that question advanced in any way so long as people did not expect that simply by pouring out Government money they were going to get a solution In this big campaign for national fitness which the Government deserved the greatest credit for initiating, we should not forget that while the campaign was being arranged to call attention to public service and public institutions already provided nine people out of ten could remain happy if they liked on their own resources and by personal effort without going to outside help or institutions

Mr A V ALEXANDER said Mr Ellis Smith had made out a case for investigation the whole basis of ex service men s pensions should be re-examined in the light of medical experience since the war Turning to the question of nutrition he said 5s 9d was the figure fixed by the British Medical Association on the basis of the cost of living in 1933 when the Ministry of Labour index for food alone was 18 as compared with 43 now On present prices about 8s per person per week would be required on the very low scale drawn up by the British Medical Association

Mr BURGIN replied for the Government and the debate was adjourned

THE CASE FOR INCREASED PRODUCTION OF MILK

It was resumed on October 28 Dr HADEN GUEST said the Government was not dealing with the distressed areas the terrible housing conditions which still persisted and the poverty due to poor wages Milk was now 7d a quart and was going up to 7½d On the standard recommended by a Government committee the expenditure for the family of a man with a wife and four children with milk at 3d a pint should be 40s a week on food and 15s on milk alone The sum necessary to increase the milk production of this country by one third which would reach the amount required according to the physiological standards of the experts on nutrition was something in the neighbourhood of £20 000 000 a year but the cost of medical treatment in this country was £300 000 000 and if the milk supply were increased to give every child the amount of milk it needed £75 000 000 of that sum could be struck off

Mr H RAMSBOTHAM replying as Minister of Pensions said it was difficult in the long period since the war to establish a continuous medical history but the 1937 report of the British Legion said that during the previous twelve months fifty nine first claims to pensions had been successfully handled by the Legion while no case of this nature had been unjustly rejected Researches and medical opinion in this and other countries did not confirm the view that the general health of the ex service man of middle age was impaired by his war experience Cases of doubt were referred to an independent medical specialist appointed from a panel chosen by the President of the Royal College of Surgeons or the Royal College of Physicians and that opinion was accepted.

Legislation on Milk Pasteurization

On November 1 Sir THOMAS MOORE asked the Minister of Agriculture if he had accepted the conclusions of the recent investigation by the Hannah Dairy Research Institute which showed that the growth of calves fed on pasteurized milk was no less than that of calves fed on raw milk while the tuberculous infection of the latter was far more serious Mr W S MORRISON replied that this investigation was only one of a number designed to test the nutritive value of pasteurized as compared with raw milk The Government would bring forward legislation this session to give effect to its policy on pasteurization His attention had been called to a statement in the report of the institute that of the forty-seven samples of mixed raw milk used in connexion with their experiments 70 per cent. showed the presence of viable tubercle bacilli The presence of such bacilli in a sample of milk varied according to a number of factors and in particular whether the milk had been obtained from a single herd or whether it was representative of the bulked supply from a number of herds The results of a particular experiment such as that quoted in the question could not therefore necessarily be accepted as representative of milk supplies as a whole

Silicosis Investigation—Lord WINTERTON announced on October 28 that the investigation organized by the Medical Research Council into silicosis and allied conditions among coal miners is in progress. It is beginning with an intensive study of a particular anthracite pit Clinical and radiological examinations are being made of a large number of mine workers and the occupational histories of these men are being recorded Parallel investigations are to be made into the geological and other physical conditions of the colliery

Medicine Stamp Duties—Asked on October 28 whether legislation was intended this session to amend the law relating to the medicine stamp duties Sir JOHN SIMON said the recommendations of the Select Committee on these duties were being examined in the light of many representations received after publication of the report of that committee

Grants for Housing—Answering Sir Francis Fremantle on October 28 Sir KINGSLEY WOOD said he hoped to introduce in the near future a Bill dealing with the grants for slum clearance and overcrowding. The Bill would carry out his promise that contributions at the present rates should be payable for houses completed between March 31 and December 31 1938 and would make new provision for grants for this purpose He was in consultation with the Association of Local Authorities as to the form and amount of these grants He proposed also to include in the Bill provision to give effect to a recommendation recently made to him by the Central Housing Advisory Committee that Exchequer assistance should be made available towards the erection of houses for the agricultural population

Medical Aid for Civilians in China—On November 1 Mr EDEN replying to Mr Ellis Smith said that at the meeting of the Council of the League of Nations on October 1 the British Government s representative agreed that the League s Health Committee should be asked to prepare a plan to advise and assist the Government of China with anti-epidemic and medical aid for the civilian population The British Government expressed general sympath with the suggestion to open a voluntary fund but reserved its position in regard to contributions to it.

LADIES' DEPT ON 1st FLOOR

Broken Sleep

"T L. P, in reply to Argyleshire" (October 16 p 782) writes A small degree of hepatic insufficiency may be the cause and this may be corrected by taking a ferrous compound (stable ones are made by Parke Davis and by Burroughs Wellcome) either at the period of heaviness at midday or with the afternoon cup of tea This treatment has been effective in cases of hunger pains coming on at 2 a m or thereabouts associated with symptoms of indigestion of duodenal origin

Treatment of B coli Pyelitis

Mr W F FEDDEN writes Replying to "A B U" his case is very highly suggestive of an impacted ureteric calculus and needs thorough urological and radiological investigation Incidentally I am operating on such a case to-day in a girl aged 2½ years

Chronic Stomatitis

"GASTROSCOPIST writes A persistent stomatitis of the type which X Y Z. describes (*Journal* October 23 p 836) is usually associated either with a progressive atrophy of the gastric mucosa or with recurrent attacks of gastric erosions, which may be symptomless. In either event the *p*H of the stomach does not fall as low as it should and the colonic flora extend high into the small gut This is the rationale of the vitamin C treatment which is favourably reported on from the Continent. Vitamins A and B are also of course theoretically indicated and I have seen moderately convincing results from blunderbuss therapy for stomatitis after gastro enterostomy Constipation and the free use of aperients are both associated with the gastritis—but it is uncertain which is the horse and which the cart. Both might act on the stomach by causing duodenal regurgitation, which is the most potent known cause of inflammation. There is also a little evidence that both can cause selective failures of absorption tending to aggravate the poverty of a modern diet There is no evidence that the habitual use of phenolphthalein is any more harmful than that of many other aperients on the other hand no carefully collected statistics are available to guide us The therapeutic test of excluding phenolphthalein is well worth trying in some of those unsatisfactory cases of the hunger pain syndrome which are being diagnosed as cases of duodenal ulcer

Dr ALISTAIR FRENCH (Middlesex) also writes "X Y Z." might be suffering from a bacterial allergic stomatitis and the best treatment therefore would be to remove the cause by having the pyorrhoea cured Locally if the infection is spirochaetal N A B may help and if not S T 37 toothpaste and mouthwash can be tried If the usual potassium chlorate has failed to give relief I suggest that internal medication with calcium and vitamin D may help X Y Z. does not mention smoking, which obviously may be an irritating factor

Rapid Method of Examining Urethral Discharge for Gonococci

Dr F G MORGAN (Peterborough) writes I shall be pleased if you will kindly give me details of a method for quick examination in the surgery of urethral discharge for suspected gonococci

We are indebted to Dr T E. Osmond for the following reply Make a thin film by spreading a platinum loopful of pus obtained from inside the urinary meatus with a slide as in making a blood film Dry with gentle heat and pass rapidly three times through a Bunsen flame Cool Stain by Jensen's modification of Gram's stain as follows (1) Cover film with a 0.5 per cent watery solution of methyl violet for fifteen to thirty seconds (2) Pour off and flood the film with strong Lugol's solution (iodine 1 part potassium iodide 2 parts distilled water 100 parts) Repeat this and leave for thirty to sixty seconds (3) Decolorize with absolute alcohol till no more colour comes away Maximum time two minutes (4) Counter stain with neutral red 0.2 per cent. for thirty seconds and wash in distilled water Blot dry Gonococci appear as rose pink diplococci kidney-shaped with their concave surfaces opposed usually intracellular In acute cases it is common to find a single pus cell here and there crowded with gonococci Details may be found in the Medical Research Council's Special Report Series No 19 1923 H M S O., price 1s 6d

Income Tax

Taxation of a Prize

"EXTRA during the year 1936-7 was awarded a prize of £50 by a professional organization Is this liable to taxation?

*** Normally liability would not attach to a "prize" There may however be circumstances which would displace that assumption—for example in the case of a "prize" for a novel where there was a condition that the copyright should be transferred to the giver The broad distinction would be between a prize unconnected with a contract or payment of a sum which though called a prize represented consideration for the result of professional work and skill

Employment First Period

M B., Ch B graduated in December 1935 He agrees the amount of tax charged on his earnings for the year from April 5 1936 subject to a life assurance adjustment but cannot see why he should have to pay £6 14s 6d on £73 2s earned prior to that date

*** We cannot identify the basis of calculation from the figures supplied but *prima facie* the £6 14s 6d is excessive if indeed he is liable at all Possibly no declaration was made by "M B., Ch B for the financial year 1935-6 and consequently the earnings for that year so far as known to the authorities have been assessed at the full rate without allowances" We suggest that our correspondent should write to the inspector of taxes asking him to supply details of the assessment on which he paid the £6 14s 6d —the collector will forward the letter to the proper quarter if requested—and he will then be able to take steps to put the matter right

Distraint for Unpaid Tax

"P Q R" was liable for £124 4s. 1d income tax as at July 1 1937 On August 4 he sent a cheque for £24 4s 1d to his accountants, following it with a cheque for £50 post-dated to October 1 He received the official receipts for the two sums On October 11 a writ was served and a bailiff put in possession In forwarding the receipt for the £50 the collector had written on October 5 saying that unless payment of the balance was made without delay he would have no alternative but to proceed to recover that sum Our correspondent is on the point of seeing the income tax authorities and asks for advice on some specific points "The amount shown on the writ as outstanding was £100" but it was altered to £50 by the official who called here with the bailiff

*** Section 162 of the Income Tax Act 1918 provides that "if a person neglects or refuses to pay the sum charged the collector shall distrain without any further authority for that purpose than the warrant delivered to him on appointment" It is clear from this that no "writ" is required and the document which was altered was presumably the memorandum of the amount due which has to be served to show what sum is distrained for and as the error was corrected at once we doubt whether an action for illegal distraint could successfully be founded on that mistake On the other hand it is plainly an inexcusable official error committed in a matter of grave importance The charges in a case of distraint are fixed by scale and cannot be avoided we presume that the amounts stated are not affected by the difference between the £50 and the £100 but no doubt "P Q R" can get an official assurance or admission on that point

It seems clear that the distraint would not have been made if the payment of the £50 had not been overlooked The receipt for that sum was sent to our correspondent's accountant on Tuesday October 5 and the collector's covering letter forwarded by him on Friday the 8th Obviously insufficient further time had been given when the distraint was effected on Monday the 11th—in fact if the collector had written to "P Q R" *direct* on the 5th he would surely have allowed another week for his warning to have effect

On the whole we doubt whether "P Q R" has a legal claim for damages but representation of the facts to head quarters should ensure at least a reprimand of the collector for carelessness and an ample apology

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

359 Vitamin D in Rickets

OPITZ (*Dtsch med Wschr* August 6, 1937 p 1213) who is attached to the Kaiser and Kaiserin Friedrich Children's Hospital in Berlin, gives an account of the investigations he has carried out on children suffering from rickets They were given large single doses of a concentrated, crystalline vitamin D preparation by the mouth (1 c.cm containing 15 mg of vitamin D) Altogether sixty two children most of them under the age of 2, were treated by this method and only in two cases was more than a single average dose of 0·4 c.cm given The effects of this single dose were studied clinically radiologically and chemically, the calcium and phosphorus content of the blood being estimated from time to time The author was impressed by the rapidity and sureness with which a therapeutic effect was secured and he thinks that this single-dosage method will render superfluous the protracted treatment in hospital of cases of rickets In forty two of his sixty-two cases rickets was associated with spasmophilia and it was found that patients suffering from both these conditions were more amenable to vitamin D medication than were the patients suffering from rickets alone This observation supports Rominger's opinion that spasmophilia marks a stage during recovery from rickets

360 Tularaemic Pneumonia

M D WINTER B C FARRAND and H J HERMAN (*J Amer med Ass* July 24, 1937 p 258) record three cases of tularaemic pneumonia and one case of tularaemic bronchitis with pleural effusion in Montana U.S.A One of the pneumonia cases was complicated by encephalomeningitis but a good recovery was made after daily spinal drainage The treatment used was largely symptomatic with the addition of intravenous injections twice daily of 1.2 grammes of sodium salicylate dissolved in 30 c.cm of distilled water all the cases recovered Dyspnoea on exertion and general weakness were experienced for some months after recovery and were probably due to toxic myocarditis All the patients were farmers or shepherds and since they had been bitten by ticks the infection probably entered through the skin though possibly food contaminated by the fingers had been eaten The pneumonia was atypical with a relatively low white cell count and a slow evolution of the lung changes The blood in all four cases showed positive agglutination tests for *B tularense*

361 Ephedrine in Enuresis

E ÖRKILD (*Ugeskr Laeg* August 12 1937 p 851) has exploited in several cases of enuresis the properties of ephedrine which he had previously found responsible for disturbances of micturition with sometimes more or less retention of urine in three cases of elderly men One of these aged 63 suffered from heart disease and had a high blood pressure and pulmonary oedema and the administration of ephedrine was followed by difficulty in micturition although there had not been any previous dysuria After seeing two other cases in which the ephedrine disturbed micturition the author proceeded to give this drug for the relief of enuresis The first case he records was that of a male aged 18 in whom the nocturnal enuresis of childhood had persisted He was given 50 mg of ephedrine hydrochloride in tablet form at bedtime every other evening Several months after discontinuing this treatment he was still symptom free After giving details of several other cases of nocturnal enuresis in children successfully treated in this way the author records the case of a man aged 23, who suffered from transverse myelitis with incontinence of urine The successful response to ephedrine in this case has encouraged the author to recommend it for the dysuria of other nervous diseases

Surgery

362 Congenital Dislocation of the Hip

P ANTONIO (*Arch Ortop* Milano, March 31 1937, p 3) reports thirty four years experience of congenital dislocation of the hip comprising 8,196 cases of luxation and 414 of subluxation The ratio of incidence among males and females was as 1 to 5·39 and in almost two-fifths of the cases the deformity was bilateral but recently, probably as a result of better diagnosis the number of bilateral cases has exceeded the number of unilateral cases Three quarters of the unilateral cases were left sided Compared with other congenital hip deformities and torticollis, dislocation of the hip was respectively twice and ten times as common Other congenital deformities accompanied it in 5·6 per cent of cases—of the foot in 3·7 and of the neck in 0·4 per cent of cases The incidence was considerably greater in regions of low hills than in the plains or alpine regions Hereditary transmission was noted in no fewer than 7·6 per cent of cases more commonly through the father than the mother in a further 18·7 per cent of cases a near relative was similarly affected Dystocia was not an aetiological factor and deformity was noted at birth or during the first month in 6·3, and at walking age in 90 per cent of the children In treatment the Paci Lorenz bloodless reposition was preferred and was performed in 7 561 cases or 90 per cent after five years it gave 61 per cent of satisfactory results in unilateral and 39 per cent in bilateral cases The first plaster fixation in flexion and abduction usually lasted for from two to three months the second in 30 degrees flexion and in 45 to 90 degrees abduction for from four to six weeks, and the third, in extension with 35 to 40 degrees abduction and 50 to 60 degrees internal rotation (Lorenz's second stage) for from one to two months The first reduction and the passage from the first to the second position were conducted under ether anaesthesia Reductions by open operation were necessary in 0·37 per cent and 3.3 per cent were treated by palliative surgical measures including osteotomy cotyloid plastic operations etc Open reduction resulted in 32 per cent of good results in those treated before the age of 5 and in 20 per cent in children over that age

363 Carcinoma of the Pancreas

J RIVES S ROMANO and F SANDIFER (*Surg Gynec Obstet* August 1937 p 164) comment on the relative commonness of carcinoma of the pancreas and analyse ninety six cases of which seventy-eight were in males and eighteen in females and all of which were verified by operation or necropsy The average age of the patients was 58 and the condition was most often found in patients between the ages of 50 and 69 Although the pathogenesis is obscure it is not considered probable that chronic pancreatitis is the cause of pancreatic malignancy as is sometimes suggested In 85 per cent of cases the head of the pancreas was involved and metastases occurred most often in the liver The most important symptoms of carcinoma of the pancreas are jaundice pain dyspepsia cachexia and nausea and vomiting It is suggested that the pain is due to direct infiltration and distension of the pancreas with blocking of the pancreatic ducts and severe pain may be due to infiltration of adjacent viscera or haemorrhage into the gland with pancreatitis X ray examination is of value as an aid to

ST. ANDREW'S HOSPITAL

FOR MENTAL DISORDERS

NORTHAMPTON.

FOR THE UPPER AND MIDDLE CLASSES ONLY

President THE MOST HON THE MARQUESS OF EXETER C M G A D C

Medical Superintendent DANIEL F RAMBAUT M A M D

results are usually obtained from a quantity of radiation corresponding to between 0 6 and 0 9 millicurie hours per square centimetre The treatment may be safely repeated several times at intervals of from one to two months In cases in which x rays or radium emanation have failed good therapeutic results are sometimes achieved by the Finsen lamp or, better still, by the intensol lamp"

369 Hypertrichosis

A MEMMESHEIMER (*Med Klinik* August 20 1937 p 1133) discusses various therapeutic agents for the removal of hair for cosmetic reasons He has never found hormone therapy for hypertrichosis due to disturbances of internal secretion to be of the slightest use He considers thallium and treatment by x rays to be dangerous The former, when administered over a long period gives rise to severe inflammation of the nerve roots the latter to pathological changes in the skin teeth mucous membranes and bones Electrolysis is of value for the removal of hair in small areas but over large areas it produces ugly scars Memmesheimer considers electrocoagulation with the diathermy apparatus as the most efficient, rapid, and painless depilatory agent From one to five fine needles are introduced to a depth of 4 mm care being taken that each needle is from 1/2 to 1 cm away from the other, so as to avoid any loss of smoothness and elasticity in the skin and the production of large scars The current is applied for from one half to two seconds and the dead hair removed with forceps thirty hairs being removed at one sitting The optimal strength of the current is discovered by depilating an area which is not usually visible Overdosage results in hypertrophic scars which unless keloid changes develop, disappear in the course of a few months

370 Toxic Effects of Arsenic

SIEMENS and SIMONS (*Munch med Wschr* September 10, 1937 p 1444) have treated 137 cases of psoriasis with the Gebert arsenical cure fifty seven patients being submitted to the strong and eighty patients to the weak" cure All of them showed toxic effects and only a few were able to stand the strong cure for a considerable length of time There was little evidence of an increased tolerance to arsenic during the course of treatment the reverse being usually found No ill effects resulted from an abrupt cessation of the cure suggesting that the commonly practised gradual cessation of arsenical cures is unnecessary The pepper which enters into the composition of the arsenical pills used may cause disagreeable symptoms and is therefore better omitted The cure was never followed by an increase of body weight in fact stout patients often lost weight In more than one third of the cases the skin showed evidence of melanosis which was more common after the weak than after the strong cure Arsenical herpes zoster was observed in thirteen patients treated with the "weak" cure and in only one with the strong cure The herpes usually subsided even when the treatment was continued

371 Chronic Urticaria

K HAJOS (*Med Welt* September 18 1937 p 1317) points out that endogenous and exogenous factors contribute to the production of urticaria In chronic cases cutaneous tests often fail to discover the cause and desensitization is thus impossible The removal of all septic foci such as teeth tonsils appendix etc, is indicated The author noted that many cases occurred in association with dyspepsia and were often due to intestinal parasites He submitted every case of chronic urticaria to a complete gastrointestinal examination and found that achylia was present in 15 per cent hypochylia in 11 per cent and hyperchylia in only 1 per cent He believes that these gastric abnormalities favour the absorption of substances foreign to the body and their passage into the blood Cholecystitis also is often present in patients with chronic urticaria Hajos recommends the administration of hydrochloric acid to counteract hypoacidity Autovaccines are useful in immunizing the body against bacteria and duodenal and colonic wash-outs at regular intervals are helpful Resistant cases should be desensitized with their own blood or if possible serum The author advocates the withdrawal of 100 c cm of blood the serum is then preserved with 1/2 per cent phenol and put up in sterile ampoules 2 c cm being injected daily The author also reports good results following desensitization the skin reaction to 1/1 000 mg of histamine was tested and this dose gradually increased to 1/10 mg, was injected subcutaneously

372 Erysipelas

S PUPKO (*Thèse Paris* 1937 No 537) records twenty five cases in patients aged from 1 month to 85 years all of whom died pulmonary complications being the most common cause of death while cardiac renal and hepatic complications came next The condition of the liver in cases of erysipelas is of considerable importance in determining the prognosis as involvement of this organ especially when due to alcohol gives rise to a severe attack, and favours the onset of septicaemic and other complications Previous illnesses organic lesions, operations or injuries weaken the patient's resistance The prognosis is most grave in children up to the fourth month of life and in adults over the age of 60

Obstetrics and Gynaecology

373 Cancer of the Uterus

P MOULONGUET and L GASNE (*Gynécologie* July 1937 p 387) point out that the classical features of carcinoma of the body of the uterus—*post menopausal bleeding* with at first the maintenance of good general health—are actually due to that condition in only some 33 to 67 per cent of cases according to different statistics Post menopausal haemorrhage may be caused by cardiac insufficiency senile metritis or pyometra or cervical polypus greater difficulties in diagnosis occur when it is due to ovarian tumour and especially to small carcinomata or folliculomata The latter cause metrostaxis of endocrine origin but not necessarily of a cyclical type Cancer of the body of the uterus may also appear before the climacteric according to Béclere premenopausal metrorrhagia is due to corporeal carcinomata in 8 per cent of cases There is no clinical sign characteristic of this condition—occurring during the fifth decennium just before the menopause—which can definitely distinguish it from myoma or a manifestation of endocrine functional disturbance In addition the coexistence of myomata and cancer of the body of the uterus is not uncommon and explains not only the occasional appearance of cancer of the uterus and pelvis after radiotherapy for fibroids but also that of cancer of the cervical stump after supravaginal hysterectomy for myomata Before completing a subtotal operation the surgeon should open the isolated uterus subsequently excising the cervical remnant if a carcinoma is found in the body It is also prudent before undertaking x ray treatment for myomata to obtain any information which may be given by hysterography or better still by curettage and biopsy Glandular hyperplasia is much commoner than cancer of the body of the uterus as a cause of premenopausal metrorrhagia but the latter should be excluded by curettage or the aspiration of endometrial fragments before radiotherapy is undertaken A possible source of error both before and after the menopause is the coexistence of a corporeal carcinoma with a mucous polypus "Total carcinoma of the

HEALTH RESTORED by PINES · SUNSHINE & SEA AIR

The happy combination of these three health giving properties have earned for Bournemouth an unrivalled reputation as a centre for convalescence, more especially in the case of pulmonary disorders The weight of medical evidence to this effect is attested by the highest authorities, and should induce you to recommend this delightful town to your own patients

The facts and figures relative to Bournemouth's health-giving attributes in the "Book of Bournemouth" will interest you Write for it to the Publicity Manager, Room 109a, Town Hall, Bournemouth

RESTORATIVE & FORMATIVE
for DEBILITATED CHILD PATIENTS . .

Clinical experience abundantly confirms the value of Syrup Minadex as a restorative and formative tonic for debilitated children—particularly following febrile or other illnesses, and in post-operative convalescence
Minadex has been carefully designed to supply the reserve elements that have been depleted in the patient's system Iron to regenerate the blood, calcium and phosphorus to restore neuro-muscular tone, plus vitamins A and D to bring back resistance and promote well being Syrup Minadex can be prescribed with perfect safety to all patients Its attractive flavour appeals especially to children

TO REVERSE
MENOPAUSAL CHANGES

"I cannot refrain from mentioning the treatment of the MENOPAUSAL SYNDROME with œstrin Quite small quantities of œstrin by mouth (1,000 to 5,000 units) are usually sufficient to control the hot flushes headaches and dizziness, and to induce a remarkable feeling of well-being, and rather larger doses have a miraculous effect on such sequelæ as pruritus vulvæ, atrophic senile vaginitis, vaginal ulceration and kraurosis

LONDON SCHOOL OF HYGIENE AND TROPICAL MEDICINE
INCORPORATING THE ROSS INSTITUTE

POSTS OVERSEAS FOR MEDICAL MEN

A register is kept in the School of medical men who are prepared to be considered for posts overseas, and the School is frequently asked to advise plantation and mining companies when such posts fall vacant

The salaries offered are attractive, conditions of service are governed by standardised forms of contract, and many of the posts offer to medical men a most interesting field in which to practise their profession

It is desirable that candidates for posts overseas should hold a diploma in tropical medicine and hygiene The course provided by the London School for the Conjoint Board's Diploma lasts six months and the tuition fee is £40 The course may be taken from October to March or from January to June There are generally more vacancies in the course commencing in January

The Director of the Ross Institute is always glad to interview medical men who would like information regarding the possibilities of a career overseas if they will be good enough to make an appointment to call on him Enquiries may be addressed to

SALT'S PATENT KIDNEY CORSET

as an alternative to the Kidney Belt

● The only practical difference between Salt s Patent Kidney Corset and the Kidney Belt is in the matter of style In all other respects the Corset is identical with the Belt It gives the same corrective support really retaining the Kidney in its proper position and obviates symptoms due to dragging on the renal ligaments Incidentally this Corset can be modified to almost any style to which the patient is accustomed Doctors are invited to write for Salt s Corset and Belt Book—the publication which gives full information about this Appliance and other individually produced Surgical Fitments issued by this House

"CERABAN" ADHESIVE SELF-SUPPORTING BANDAGE

The Supplementary or Alternative Treatment to Self Adhesive Elastic Bandages for

SPRAINS, DISLOCATIONS, CONTUSIONS, SWELLINGS, VARICOSE VEINS, VARICOSE ULCERS, ETC

Its use eliminates the risk of Dermatitis which so frequently arises from the application of Self adhesive Bandages

"CERABAN," whilst free from rubber possesses elastic properties and when carefully applied to the limb gives substantial support It is porous adhesive and non irritating will not chafe and permits of complete respiration of the skin

In the treatment of Varicose Ulcers the use of Ceraban Bandage eliminates the risk of Dermatitis which occasionally occurs through the application of self adhesive Elastic Bandages In the less severe of such cases a distinguished authority writing in the *Lancet, page 580 Sept 7th, 1935, issue* recommends the use of Ceraban Bandage cut in strips as a first and protective dressing prior to covering with self adhesive Elastic Bandage and in the more serious cases the complete replacement by Ceraban It is waterproof antiseptic and being spread on an extensible material readily conforms to the shape of the limb and therefore will not slip

Socks of character

It is an interesting fact that the wool used for Two Steeples No 83 Socks is of the same high grade as used for the "quality" suitings bought by the best tailors The No 83 Sock is in fact, a close relative to the English and Scottish cloths that are famous throughout the world the only difference being in the way the yarn is spun This is to meet the technical requirements of the knitting machine as distinct from the weaving loom.

Your hosier will be pleased to show you this sock made in a shade for every suit Sizes 8½ to 12" 4/6 per pair

Pattern booklet of wide range of quality socks and underwear sent on request to Dept. 4 "Two Steeples" Ltd. Wigston, Leicester hire

PISTANY MUD
for
persistent RHEUMATISM
Different from ordinary heat therapy
Why? Simultaneously with the physiological responses of the body to heat, reactions are caused specifically by this hot sulphur mud A detailed account of the analytical biological and clinical evidence appears in the September "British Journal of Physical Medicine
How? It is easy and clean—to apply The hot mud is wrapped in "Cellophane" in which a window is cut to expose the mud surface to be laid on the skin This method entirely meets the conditions prevailing in clinics or homes, and costs very little to apply For demonstration phone LANgham 4214 FULL INFORMATION FROM

President VISCOUNT WAKEFIELD OF HYTHE G C V O
Treasurer SIR LIONEL FALDEL PHILLIPS Bart
Physician Supt J G PORTER PHILLIPS M D., F R C P

This Registered Hospital is now situated at Monks Orchard in some 250 acres of park pleasure and farm grounds.

Applications can be considered on behalf of patients of the educated classes in a presumably curable condition With a view to early treatment voluntary or uncertified patients are admitted

Patients who can contribute 5 guineas weekly towards the cost of treatment and maintenance may be received as vacancies arise The Committee will also consider applications for admission at lower rates and in certain cases will be prepared to admit patients free of charge

Every facility for specialized investigation and treatment is provided in the Lord Wakefield Science and Treatment Unit. In this Unit is found X Ray and Dental Departments and the Bio-Chemical Pathological and Psychological Laboratories

Furthermore provision is made for Electro Therapy and Hydro Therapy to be carried out in all their forms and Occupational Therapy under competent instruction is encouraged

In addition to the Resident Medical Staff Consultants in special branches of medicine and surgery are available whenever required

The comfort of sensitive patients is greatly enhanced by the fact that the majority are given single bedrooms

For forms and further particulars apply to the Physician Superintendent at the Hospital.

INDIAN MEDICAL SERVICE

RECRUITMENT OF EUROPEAN OFFICERS

Applications are invited from Medical Men for Permanent Commissions in His Majesty's Indian Medical Service The terms offered include a gratuity of £1,000 on retirement after six years' service, or of £2,500 after 12 years service, together with free return passages, for those who no longer desire to remain in the Service In other respects the terms will be as detailed below

British subjects of pure European descent who are under 32 years of age and who are registered under the Medical Acts in force in Great Britain and Northern Ireland are eligible to apply

CAREERS

The Indian Medical Service offers a permanent career with wide opportunities of medical experience including clinical preventive specialist and research work At the beginning of his career an officer is employed on the military side which has medical charge of the Indian Army Promotion is on a time scale up to the rank of Lieutenant Colonel and by selection to the ranks of Colonel and Major General An officer may apply after one year s Indian Service to have his name registered for transfer to the civil side, from which appointments are made to Civil Surgeoncies, which are established at the principal civil centres to provide for the medical needs of Civil Officials and for general medical administrative purposes to specialist (for example public health and bacteriological) services to research posts and to professorships at the Medical Schools

Applications not later than November 13th on printed forms to be obtained (by postcard) from the Secretary, 1, St. George's Road, N.13.

KING GEORGE HOSPITAL, ILFORD, near London (207 Beds.)

Applications are invited for the posts of two CLINICAL ASSISTANTS to the ANÆSTHETIC DEPARTMENT, one to attend on Tuesday mornings and one on Friday mornings. Allowance of £10 10s. p.a. for travelling expenses. Applications should be sent to the undersigned not later than November 15th.

G. AUSTIN HEPWORTH,
Secretary and Superintendent.

Applying for Hospital Appointments

SIR,—It has recently been my lot to submit applications for appointment to the honorary staff of three different hospitals, and I wish to call attention to certain unnecessary hardships which affect those who apply for these posts First, it is practically essential to submit a printed application for a post on the honorary staff, and often desirable to do so even for the post of registrar, the cost of doing this is by no means negligible, averaging between £2 and £2 10s for each appointment applied for Further, the time taken to get in fresh testimonials and have the application printed curtails the short interval usually allowed before the application has to be sent in Secondly, it is necessary to persuade one's present or late "chiefs," or other well-known medical men one may happen to know, to give fresh testimonials for each post applied for, a proceeding which becomes irksome to them and embarrassing to the man who has to ask these favours several times at short intervals, after a succession of failures to secure posts Lastly, the most important grievance that I wish to air is in respect of visiting members of the honorary staff, generally at their consulting rooms It is essential to do this as some of them are deeply offended by any failure on the part of the candidate where this formality is concerned Of course it is a pleasure to call on some of them, who could not be more courteous or considerate, but there are unfortunately not a few whose conduct is distinguished by a lack of consideration and even of common politeness I have several times had appointments made and have found on arrival, at a time arranged to suit the consultant though at considerable personal inconvenience, that he has not troubled to keep the appointment Sometimes they or their secretaries rudely say that they will not see you, as if you were insulting them by asking, which unfortunately one has to do as things are at present Again, others think nothing of keeping one waiting sometimes as much as an hour or more, and when they eventually do deign to see one they glibly say that they are not interested in the appointment and will not be attending the meeting These formalities have to be complied with by those seeking appointment to the honorary staff, but they also apply, though usually to a lesser degree, to those seeking the post of registrar, and, in some hospitals, even to house appointments

By way of constructive criticism I would like to suggest

1 That the general rule should be that applications are to be typed or duplicated, which is quicker, cheaper and just as legible as printing

2 That the hospital secretary should definitely ascertain which members of the staff wish to be called on and should inform the candidates that they must call on these consultants and on them only

3 That some sort of preliminary selection from among the candidates should be made by the committee and the obviously unsuitable candidates ruled out before the stage of visiting begins It is obviously absurd for twenty or more candidates for one post to call on all the members of the staff when a 'short list' of the likely men would surely suffice

4 The farce of submitting testimonials might well be done away with generally most of the committee do not read them and if they do most of the testimonials read much the same— I have formed a very high opinion of Mr Smith's abilities as a surgeon. He is an agreeable and hard working man with sound judgement and fair operative ability I have pleasure in recommending him as surgeon to your hospital, etc'

The whole thing is reminiscent of the giving of a "character" to a retiring maidservant, and it would seem that some more useful and enlightening method of selection could well be adopted In view of the fact that I am likely to continue "applying for jobs' for some time to come, I beg the indulgence of remaining anonymous for my own protection—I am, etc,

London, W 1, Dec 1 F R C S

Inhalational Therapy

SIR,—Having had experience of this therapy, based on a long period of clinical investigation, I feel it would be unfair to the organization responsible for its introduction into this country, unfair also to the thousands of doctors using this treatment in different parts of the world, and unfair, too, to the numerous hospitals and institutions where it is being also used, if Dr Harrington's letter (November 20, p 1047) were left unanswered The letter, too, may be productive of a more serious injury in that it may prevent those contemplating the use of this treatment from carrying out their intention The ingredients used in the medicament have been published There is no secret about the machines, thousands are in use in different parts of the world, and I am assured there is no patent on them The treatment is only given to patients on the recommendation of their own medical attendants, and always under medical supervision The organization has never advertised How is it possible to curb newspapers when they hear of sensational benefits derived? Surely Dr Harrington does not intend to convey to those medical men using the treatment with advantage to their patients that, because of this publicity, they should dissociate themselves from the treatment.—I am, etc

Weybridge, Nov 22 A. C GREENE.

*** We understand that the formula for the mixture of drugs used in the Duke-Fingard treatment still remains undisclosed—ED, *B.M.J*

R M B F Christmas Gifts

SIR—My anxiety increases as the time for the distribution of our Christmas gifts draws near I am indebted to many of your readers who have responded to the appeal which was made in October, but I fear that the amount subscribed to date falls far short of the sum which is needed if we are to give the much-valued Christmas gift of 30s to all our regular beneficiaries

Christmas Day to all of us is a very special day, it brings back memories of happy days in the past, and all have the wish to make each Christmas Day a happy day in our own home life I have intense sympathy for so many of our beneficiaries living in loneliness, some in one bed-sitting room at a rental of 10s a week without relatives and without friends and who can look only to the Fund as the society which "never forgets them" on Christmas Day

I ask everyone who reads this last appeal not to pass it by but to send a donation, however small or large, without delay to the Hon Treasurer, Royal Medical Benevolent Fund, 11, Chandos Street, Cavendish Square, London, W 1, so that we may be in a position to give the 30s Christmas gift to those who have so little of their own and who are befriended by the Fund—I am, etc,

THOS BARLOW
President.

PROSTATIC ENLARGEMENT

& URINARY DISORDERS OF PROSTATIC ORIGIN

Urinary retention is due in the first place to the enlargement of the gland but both the congestive and spasmodic factors must be taken into consideration, as they, in themselves can cause as much obstruction as the simple enlargement.

The progress of adenomatous enlargement is slow yet the symptoms of urinary disorder, frequency, difficulty and retention, show no constant relationship between the increase in the size of the gland and the phenomena of retention.

SEDOPROSTYL is a preparation which embraces all three causes of obstruction, and the many excellent results now placed to the credit of SEDOPROSTYL have amply repaid the work of those Urologists who devised the formula.

ALASIL

Safe Salicylate Therapy

THE popularity of acetyl salicylic acid is undoubtedly due to the fact that it is one of the safest and most effective non narcotic analgesics available Too often, however, its use has been discarded by the physician on account of its tendency to irritate the stomach and because entirely pure preparations are not always available.

"Alasil provides the beneficial therapeutic effects of pure acetyl salicylic acid in such a form that it is acceptable even by disordered digestions This tolerability is due to the fact that it combines calcium acetyl salicylate—the least irritating salicylate compound—with Alocol a potent gastric sedative and antacid.

Since "Alasil is better tolerated than acetyl salicylic acid its use can be pushed or prolonged to a much greater extent than the latter "Alasil is therefore an analgesic, antipyretic, and antirheumatic which can be employed with complete confidence in all the many conditions in which such an agent is indicated

HOW IMPORTANT
ARE MINERALS IN THE DIET?

?

They are absolutely essential for the maintenance of an adequate state of nutrition However, not infrequently an apparently minor mineral deficiency may weaken the body's defensive mechanism to such a point that

Pregnancy, Infection, or any other unusual tax

may lead to a prolonged period of convalescence

!

COMPOUND SYRUP OF HYPOPHOSPHITES

TRADE "FELLOWS" MARK

THE NATURAL MINERAL WATERS
OF
KARLSBAD
Sprudel, Muhlbrunnen, and Schlossbrunnen

These waters act

(1) By immediate contact with the mucous membrane of the stomach and alimentary canal allaying pains and spasms in these organs, and stimulating the digestive organs into activity

(2) Through the blood That is, they change its condition by increasing the proportion of alkali in the blood as well as in all derivative secretions (gall urine etc)

Largely prescribed in cases of

Chronic Gastric Catarrh, Hyperaemia of the Liver, Diabetes, Gout, Gall-stones, Renal Calculi, Diseases of the Spleen, and of the Kidney and Urinary Organs

Bottled under Official Supervision at Karlsbad and regularly imported by the Sole Agents

MULTIVITE

(Vitamins A 'B' C and D)

In the Interim Report of the Mixed Committee on the Problem of Nutrition, attention is directed to the fact that in not a single country does the entire population enjoy a standard of nutrition adequate for the maintenance of health

To combat the widespread condition of subnormal health resulting from this chronic state of malnutrition, it is a policy of prudence to prescribe Multivite which contains, in the form of a palatable pellet, balanced and standardised amounts of the full range of vitamins, A 'B' C and D

The administration of Multivite is followed by a speedy disappearance of the general malaise, with cessation of such manifestations of subnormal health as lethargy and lack of vitality, intestinal irregularities and neuritic symptoms

Hexamethylene tetramine	10 0
Excipient q s	ad 1,000 c.c.

PRICE - 4/6 per 4 oz bottle.
Sample and Literature on request.

Serenol is a sedative with action on the centres of the nervous vegetative system, sympathetic and parasympathetic, and on the cortical centres Recent knowledge has shown the interaction of nervous vegetative system and endocrine system, and on this knowledge SERENOL is based It is thus a biological, not a symptomatic, sedative, and, unlike many other sedatives, has not a direct depressant action on the cortical cerebral centres

Serenol is indicated in conditions of anxiety and general irritability, insomnia, hyperthyroidism, hyperadrenalism (as in neurocirculatory asthenia, effort syndrome), the so-called nervous palpitations of the heart, etc.

Serenol is given in the following dosage For mild cases one to two dessertspoonsful on retiring For more severe cases one dessertspoonful at 10 a m , one dessertspoonful at 4 p m and two dessertspoonsful on retiring

Serenol, being a biological sedative containing no barbiturate, is not habit forming

Serenol is a sedative with action on the centres of the nervous vegetative system, sympathetic and parasympathetic, and on the cortical centres Recent knowledge has shown the interaction of nervous vegetative system and endocrine system, and on this knowledge SERENOL is based It is thus a biological, not a symptomatic, sedative, and, unlike many other sedatives, has not a direct depressant action on the cortical cerebral centres

Serenol is indicated in conditions of anxiety and general irritability, insomnia, hyperthyroidism, hyperadrenalism (as in neurocirculatory asthenia, effort syndrome), the so-called nervous palpitations of the heart, etc.

Serenol is given in the following dosage. For mild cases one to two dessertspoonsful on retiring For more severe cases one dessertspoonful at 10 a.m., one dessertspoonful at 4 p m and two dessertspoonsful on retiring

Serenol, being a biological sedative containing no barbiturate, is not habit forming

SAUNDERS' NEW BOOKS

Just Issued

THE CEREBROSPINAL FLUID

Presents Facts —Not Theories

It is the purpose of this book to present facts It is not written to advance a theory of physiology or stress the merits of any single test It represents an honest effort to correlate recognized and well tried tests performed under standard and personally observed conditions

By H HOUSTON MERRITT, M D, Assistant Professor of Neurology, Harvard Medical School, Director of the Cerebrospinal Fluid Laboratory, Boston City Hospital, and FRANK FREMONT-SMITH, M D, formerly Assistant Professor of Neuropathology, Harvard Medical School, formerly Director of the Cerebrospinal Fluid Laboratory, Boston City Hospital With a Foreword by JAMES B AYER, M D Octavo of 333 pages, illustrated Cloth, 22s 6d net

Just Issued

THE BUSINESS SIDE OF MEDICAL PRACTICE

A Practical Book

Specifically written to assist the physician to organise and manage the business details of his practice A common sense decidedly practical book that successfully satisfies a long felt need

By THEODORE WIPRUD, Executive Secretary of the Medical Society of Milwaukee County, Lecturer in Medical Economics at Marquette University School of Medicine 177 pages illustrated Cloth, 12s net

Just Issued

GENERAL PHYSIOLOGY

Entirely New

A book that is understandable—lucid—and logical in its entire consideration of the subject An excellent presentation of the nature and mechanism of living matter as it is known to day Its many references make it a storehouse of information for teacher and student

By L V HEILBRUNN, Associate Professor of Zoology in the University of Pennsylvania Octavo of 603 pages, illustrated Cloth, 21s net

Just Issued

HEALTH EDUCATION OF THE PUBLIC

A Timely Book

In view of the newly inaugurated national health campaign the Lancet says the appearance of this book is opportune bringing together as it does the experience of two American scientists who have specialised for many years in the technique of health education It pays a proper regard to the ethics of professional participation in a health or any other campaign

By W W BAUER, B S, M D, and THOMAS G HULL, Ph D, of the American Medical Association's Bureau of Health and Public Instruction 227 pages, illustrated Cloth, 12s net.

A New Work

CLINICAL ALLERGY

Just Issued

A book that discusses allergy and its relation to the diagnosis and treatment of everyday diseases in a decidedly practical manner—that brings to virtually all fields of practice a new and refreshing knowledge of allergy and its application

By LOUIS TUFT, M D, Chief of Clinic of Allergy and Applied Immunology, Temple University Hospital Octavo of 711 pages, illustrated with 6 coloured plates Cloth, 36s net

By Famous Authorities

DISEASES OF THE LARYNX

Beautifully Illustrated

Deals with the practical diagnosis and treatment both operative and non operative of diseases of the larynx It is new throughout—in text and in illustration—emphatically not a restating of existing literature

By CHEVALIER JACKSON M D, Sc D LL D, F A C S Professor of Bronchoscopy and Esophagoscopy, and CHEVALIER L JACKSON, A B, M D M Sc (Med.), F A C S, Professor of Clinical Bronchoscopy and Esophagoscopy, Temple University Philadelphia. Octavo of 555 pages, with 221 illustrations, including 11 plates in colour Cloth, 35s net

REMARKABLE RESULTS

IN A WIDE RANGE OF SKIN DISEASES

Physicians reports show that the BELZEMA treatment gains controlling power over the progress of many difficult skin disorders including those of microbic and parasitic etiology Many of the cases concern lesions which had previously been unresponsive to more commonly employed treatments Furthermore these results have a gratifying permanency

These untouched photographs illustrate a case of Psoriasis of **fifteen years' duration** which was pronounced incurable Many treatments were employed bringing no response Finally **BELZEMA Ointment** and **BELZEMA Soap** were prescribed by an eminent dermatologist The result was **complete elimination of the complaint in 26 days.** The camera has convincingly portrayed the therapeutic action of **BELZEMA Ointment** and **BELZEMA Soap** We believe that your confidence in **BELZEMA** will be established soundly after a clinical trial

Advantages possessed by

BELZEMA
BRAND OINTMENT

- Complete Rapid Absorption
- Immediate Pruritic Relief
- Ease of Application
- Positive Results
- No Bandaging Required

INDICATIONS ECZEMA, PSORIASIS ALOPECIA RINGWORM DANDRUFF, ACNE and other skin disorders

BELZEMA publicity is confined absolutely to the Medical Profession and the fullest co-operation of its manufacturers and ourselves may be expected

The CONFIDENCE of the Medical Profession

Benger's Food has gained its great reputation by the constant recommendation of Medical Practitioners

By its unique self-digestive action Benger's Food scientifically adjusts fresh cow's milk, diluted or undiluted, to suit the individual needs of a patient In this respect it is different from any other Food obtainable.

Benger's is largely used as a routine treatment in all cases of impaired digestion The following comments, recently made, indicate some of the specific conditions for which the Medical Profession prescribes Benger's Food

DYSPEPSIA

"routine food in all cases of dyspepsia and disordered digestion"

"used for invalids and all gastric cases"

INFLUENZA

"very largely used for Influenza in all its forms"

CANCER

"invaluable for cancer of the throat"

"cancer of the stomach — doing well on Benger's Food"

THE AGED

"very beneficial for man of greatly advanced years"

"invariably used for invalids & aged persons."

We Suggest that You Recommend THE ORIGINAL PINEAPPLE JUICE FROM HAWAII

THIS appetising fruit-juice from Hawaii offers a sparkling change from routine fruit juice menus Children especially like it Because it is assimilated so easily it is ideal for babies That is why, when your patients ask your advice about fruit juices, we suggest that you recommend Dole—the *original* Hawaiian pineapple juice This delicious, golden juice is sealed in tins by the exclusive Dole Fast Seal Vacuum Packing Process That is why Dole Pineapple Juice retains, in high degree, the fresh fruit constituents of ripe pineapple, as well as the fragrant, field fresh flavour Also it is a natural source of vitamins A, B, & C

J K. Husband & Co, Ltd, 10 Eastcheap, London, E C 3

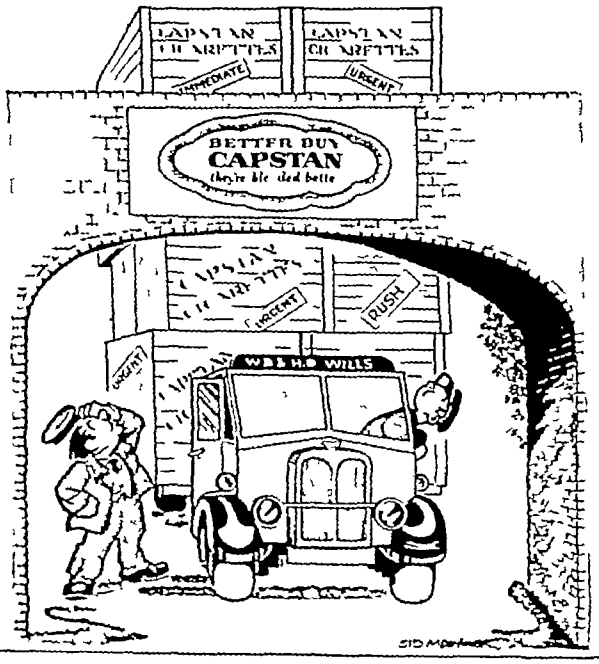
Here is a typical Analysis of Dole Pineapple Juice

Moisture	85 3%
Ash	0 4
Fat (ether extract)	0 3
Protein (N × 6 25)	0 3
Crude fibre	0 02
Titratable acidity as citric acid	0 9
Reducing sugars as invert sugar	12 4
Carbohydrates other than sugars (by difference)	0 38

THE SURF RIDER.—Surfing, the sport of Hawaiian kings in olden days, was one of the favourite pastimes. Owing to the way the surf breaks on the reef Waikiki is the only place in the world where this sport is indulged in under ideal conditions.

It is a marvellous sight to see the upright gleaming brown bodies of the native surfers come riding swiftly shoreward on a giant comber

P.S. Just write to us on your letterhead and we will be pleased to send you free a sample tin of delicious Dole Hawaiian Pineapple Juice



If every home had ELECTRIC HOT WATER

Every general practitioner knows the value of plenty of hot water in times of emergency in a patient's home, and in these days electric hot water is within the reach of poor patients as well as the rich A simple immersion heater in the existing water tank ensures instant hot water day and night Short of this, an electric kettle or electric milk boiler is invaluable Both can be used in the sick room itself as electric heat is fumeless and so convenient — you don't even have to strike a match But many patients do not as yet realise what an efficient and inexpensive hot water service electricity offers them

For further information apply to the British Electrical Development Association 2 Savoy Hill London W C 2 or consult your local Electricity Authority

The health of the woman—

and consequently her vitality, her well-being, her social security—

is shaken by nothing so much as by extensive leucorrhoea—frequently a symptom of serious genito-urinary diseases

In such cases the patient is ever grateful to the doctor who can help her by treatment which is sure and rapid in action, and, since no irrigating apparatus is required, is simple and easy to use

SPUMAN FOAM THERAPY

Spuman therapy, with its approved Spuman combinations, provides a suitable remedy for every type of leucorrhoea.

Survey of indications for Spuman

Leucorrhoea of constitutional origin, non-specific vaginal catarrh

Spuman c Lactic Acid

Gonorrhoea (also the ascending type), purulent inflammation of the urethra, gonorrhoeal vulvovaginitis

Spuman c Protargol
Spuman c Silver Nitrate
Spuman c Zinc Sulphate
Spuman c "Ichthyol"

Post gonorrhoeal leucorrhoea, leucorrhoea containing trichomonas

Spuman c Salicylic Acid
Spuman c Silver Nitrate

Adnexitis, Parametritis, inflammatory tumours

Spuman c Salicylic Acid
Spuman c "Ichthyol"

Endometritis, Portio erosions

Spuman c Salicylic Acid
Spuman c "Ichthyol"
Spuman c Zinc Sulphate

This form of treatment is inexpensive, as a rule 1 Styli is used once or twice daily

Styli for vaginal, cervical and urethral use are supplied. Boxes of 12 and 20 Styli

PHARMACOLOGICAL ACTION OF BOVRIL

In a recent series of tests on human beings, it was found that Bovril possessed exceptional power of stimulating gastric secretion, surpassing that shown by any other substance studied, and that the secretion was of normal hydrochloric acid content

This furnishes a definite pharmacological reason why Bovril should be considered an important adjunct to medical treatment

Following most acute illnesses there is commonly a depression of gastric secretion, and the secretion is poor in hydrochloric acid In such cases Bovril helps by stimulating the gastric mucosa and restoring the gastric juice to normal, both in volume and activity

"Vitamin B_1 deficiency an outstanding fault

in the diet of many millions of people"

(*B.M.J.* 16 Oct., 1937, p 753)

The reduction in Vitamin B_1 intake, due to changes in dietary habits during the last hundred years, normally amounts to at least 50 per cent, and may be as much as 70 per cent

It has been demonstrated, both experimentally and clinically, that a shortage of Vitamin B acts as a limiting factor in the maintenance of health and nutrition, and often results in gastro-intestinal disorders, loss of appetite, indigestion, constipation and, if long continued, to neuritis and arthritis

The logical way to rectify such shortage is to restore to the diet the Vitamin B-containing substance whose removal is responsible for the deficiency

This substance is available in the form of Bemax

1 For years it has been the policy of the proprietors of Bemax to ensure its Vitamin B_1 activity by biological assay of *every day's output* So far as is known, Bemax is the only food product for which such a claim is or can be made.

2. The quantity of Vitamin B_1 supplied by the normal daily dose of Bemax—one tablespoonful—is 200 International Units, an amount sufficient to raise a deficient diet to an optimal level.

3 The normal daily dose of Bemax supplies, in addition to Vitamin B_1, significant quantities of Vitamins B_2 and B_6, Copper, Iron and Phosphorus as well as rich quantities of Vitamin E and other essential dietary elements

4 Bemax is an entirely natural product consisting only of stabilised wheat germs selected for their Vitamin B_1 activity with no addition whatsoever

BEMAX

A unique natural source of accessory nutritional factors

Clinical sample and literature on request

The Bemax Laboratories (Dept. B 18) 23 Upper Mall, London, W 6

malignancy, and set forth his conclusion that malignant transformation of a peptic ulcer is an uncommon event Dible (1925), in a series of 126 resected gastric ulcers with no clinical suspicion of malignancy, found no microscopical evidence of cancer In cases in which a clinical suspicion of malignancy was entertained 4 per cent showed carcinoma Stewart (1931) found an incidence of 6 1 per cent of carcinoma in a series of 277 chronic ulcers removed at operation, and in 109 operation specimens of carcinoma of the stomach he found 15 6 per cent showing evidence of having originated in a pre existing simple ulcer Newcomb (1932) in another careful pathological investigation found that 3 75 per cent of the gastric ulcers showed malignant change, and that 13 per cent of cancers gave evidence of previous peptic ulceration I would remark that it is much more difficult to be sure on histological grounds that a cancer has been preceded by an ulcer than that an ulcer is showing an early cancerous change

There are, however, considerations other than the histological evidence to be taken into account, and not the least important is the marked difference in the prevailing sites of ulcer and of cancer I have reduced Stewart s statistics on this point, which are based on a large number of cases, to the form of diagrams (Figs A and B) You

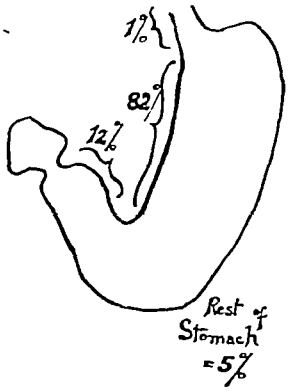

FIG A.

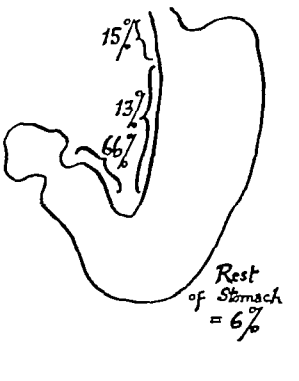

FIG B

will see that whereas in chronic ulcer 82 per cent occur on the middle two-thirds of the lesser curvature and only 12 per cent. in the prepyloric region, in cancer 66 per cent are found in the prepyloric region, and only 13 per cent on the portion of the lesser curvature that is the favourite site of ulcers These figures speak most eloquently against any close causal connexion between ulcer and cancer

Another important piece of evidence on this point is found in the hour-glass stomach 90 per cent. of these occur in females, and they result from lesser-curve ulcers of extreme chronicity, with an ulcer history commonly extending back some twenty or thirty years Surely if the irritation of gastric ulcer commonly gave rise to cancer, it is in these hour-glass ulcers that the incidence of cancer should be the highest Yet we find that such a change is of extreme rarity Thurstan Holland (1921) in a radiological and clinical investigation of 128 cases of hour-glass stomach (120 females and eight males) found that only one female and two males proved to have cancer To suggest as Sir James Walton (1936) does, that the ulcers giving rise to hour-glass contraction are different from ordinary gastric ulcers seems to me unwarranted There is no histological basis for the suggestion, and the preponderance of female cases is simply due to the different shape of the long narrow J-shaped stomach in the female, in contrast with the shorter and broader stomach of the male

Again, the clinical evidence derived from a study of the duration of gastric symptoms provides a powerful argument against a close connexion between the two lesions I pointed out some years ago (1923) that in fifty-four cases of proved cancer of the stomach the average duration of gastric symptoms before examination was 12 7 *months* whereas in forty-five cases of proved simple chronic ulcer the average duration of symptoms was 10 3 *years*

I should be the last to deny the possibility of a carcinoma originating in an ulcer, but I hold that the malignant transformation of ulcers is less common than many authorities would have us believe It sometimes happens that a carcinoma originates in the same stomach as an ulcer at some point remote from the ulcer In one of my cases, that of a woman with fifteen years' history of ulcer and six months symptoms of pyloric obstruction, I found an early annular carcinoma of the pylorus, and an inch away from it, and separated from it by healthy mucosa, the crater of a chronic ulcer Had that stomach been removed a little later, when the malignant growth had encroached upon the ulcer crater, one would have been tempted to believe that the cancer had started in the ulcer I have seen three cases of old duodenal ulcer in which, some years after gastro enterostomy for the ulcer, cancer developed independently in the body of the stomach Had these ulcers not been proved to be duodenal by the previous operation they would probably have been held to be the precursors of the malignant growths

It is probable that many of the cases diagnosed on clinical history as ulcer-cancer are really cases of primary cancer of unusually slow growth We are familiar with the very slowly progressive atrophic scirrhus in the breast It is not uncommon to see them after four or five years of growth and even longer, still without widespread or obvious secondaries, and comparatively small in size It is not sufficiently realized that while most cancers of the stomach run a course of under two years from the first symptom to the fatal end, yet there is a type of cancer, not very uncommon, which may arise in any part of the stomach and is so slow in growth that the total duration of the symptoms may be three, four, or even five years from start to finish This type of growth may simulate simple ulcer clinically to a remarkable degree, and yet be a cancer from the beginning Beyond doubt, in my view, these slow-growing ulcer-simulating cancers have unduly swollen many surgeons' lists of cases of ulcer-cancer

The Relation of Gastritis to Cancer

But if I have convinced you that the danger of malignant degeneration of a simple gastric ulcer is to a great extent a bogy, we have not yet exhausted the possible predisposing causes of gastric cancer In 1929 A F Hurst in his Schorstein Lecture lent all the weight of his great authority on this subject to the view that diffuse atrophic gastritis associated with achlorhydria is an almost universal precursor of cancer of the stomach, and that the chief hope we have for the prophylaxis of this dread disease lies in the recognition and treatment of the gastritis He holds that ' the achlorhydria so commonly associated with cancer of the stomach is a result of chronic gastritis which precedes the onset of the carcinoma and is in fact the most common predisposing condition He says, I have never seen a case of carcinoma in which free hydrochloric acid was present at an early stage and disappeared as the disease advanced ' When a physician of Hurst s great experience of gastric disease makes such a categorical statement we

This substance is available in the form of Bemax

1 For years it has been the policy of the proprietors of Bemax to ensure its Vitamin B_1 activity by biological assay of *every day's output* So far as is known, Bemax is the only food product for which such a claim is or can be made

2. The quantity of Vitamin B_1 supplied by the normal daily dose of Bemax—one tablespoonful—is 200 International Units, an amount sufficient to raise a deficient diet to an optimal level

3 The normal daily dose of Bemax supplies, in addition to Vitamin B_1, significant quantities of Vitamins B_2 and B_6, Copper, Iron and Phosphorus as well as rich quantities of Vitamin E and other essential dietary elements

4 Bemax is an entirely natural product consisting only of stabilised wheat germs selected for their Vitamin B_1 activity with no addition whatsoever

BEMAX

A unique natural source of accessory nutritional factors

Clinical sample and literature on request

The Bemax Laboratories (Dept B 48), 23, Upper Mall, London, W.6

found that in a total of 5,204 people the incidence of anacidity was as follows

TABLE II

Age	Number of Patients	Percentage of Achylia
20–29	866	5.3
30–39	1 354	9 5
40–49	1,299	16 7
50–59	1 043	24 0
60 and over	642	35 4

It is noteworthy that achlorhydria is more frequent in women than in men in the ratio of 5 4 or 4 3, whereas the ratio of cancer of the stomach is six males to three females In Polland's series there were 17 4 per cent of females with anacidity, as against 12 9 per cent of males

It would appear from these tables that among the general population of the usual cancer age some 20 to 50 per cent of individuals have true achlorhydria without necessarily showing any gastric symptoms While there is good pathological evidence for the view that this achlorhydria may result from a clinically unrecognizable atrophic gastritis, I can see no convincing evidence in favour of Hurst's theory that the gastritis is a common predisposing cause of cancer It is a theory of great interest, and it demands careful criticism in the light of all the clinical and pathological material that we can study, but the evidence against it is considerable and that in favour of it as yet slight

Classification of Cancer of the Stomach

The usual classification of cancers of the stomach is based on their gross pathological features, and we describe fungating, ulcerating, colloid, and leather-bottle cancers Unfortunately, there is a good deal of overlapping between these types, and the classification is of more interest to the morbid anatomist than to the clinician I prefer to take a simple anatomical basis for our classification, and to divide them, according to the part of the stomach affected, into (1) cancer of the cardiac end, (2) cancer of the body of the stomach, and (3) pyloric and prepyloric carcinoma

SYMPTOMS

The first symptoms to be noticed in the great majority of cases are a vague discomfort after meals and an unaccountable failure of appetite The patient is usually of the cancer age, and has never suffered from indigestion before With the failure of appetite there is a steady loss of weight, and as a rule a progressive development of anaemia

We may now consider certain features that depend upon the site of the cancer

1 *Cancer of the Cardiac End*—In this type there is commonly, but not always an early onset of dysphagia, due to stenosis of the cardiac orifice The condition can only be diagnosed from carcinoma of the lower end of the oesophagus by radiological examination, which shows a filling defect extending into the upper part of the stomach

2 *Cancer of the Body of the Stomach*—In this position any considerable degree of obstruction is most unusual, and consequently the symptoms are vague In some cases we find no specifically gastric symptoms beyond an unaccountable loss of appetite In others there is a feeling of flatulent distension after meals, and the patient complains of offensive eructation of gas Pain is, however, slight or absent in the early stages of the disease, and the most noticeable features are a suspicious pallor of the face, some shortness of breath on exertion, due to a rapidly developing anaemia of the secondary type and progressive loss of weight Vomiting is unusual and only occasional, owing to the absence of obstruction

3 *Pyloric Cancer*—This is both the commonest type and the most hopeful It is hopeful because obstruction often arises early, and because the growth is accessible for surgical removal Pain is the most marked feature when pyloric stenosis is present, and it may closely simulate that of ulcer It often begins an hour or so after meals, it may occur in periodic attacks lasting a few days, with some days of freedom between attacks, though these remissions soon disappear, and are seldom as long as in cases of ulcer Relief is obtained by vomiting, which may be self-induced, and articles of diet taken the day before may be recognized in the vomited material If the patient is examined after a meal we find splashing in a large dilated stomach, and may see waves of visible peristalsis rolling across the stomach from left to right

A mobile palpable tumour with very little tenderness may be detected early or late according to the thickness of the abdominal wall and the position of the growth While a tumour is as a rule a late sign, it is certainly not true to say, as some do, that by the time the tumour can be detected the growth is inoperable.

Late Signs in Cancer of the Stomach

These consist in the detection of outlying secondary deposits in the liver or peritoneum, the umbilical scar, the lymph glands of the left supraclavicular fossa, or the ovaries The pouch of Douglas should be examined in both sexes for hard secondary nodules, and in the female pelvic examination may reveal the large secondary ovarian masses known as Krukenberg tumours When the peritoneum is widely invaded we find, in addition to secondary masses in the omentum, a more or less considerable ascites Massive secondary deposits in the liver soon give rise to some degree of obstructive jaundice, and are often associated with a slight irregular pyrexia and a moderate leucocytosis

Differential Diagnosis

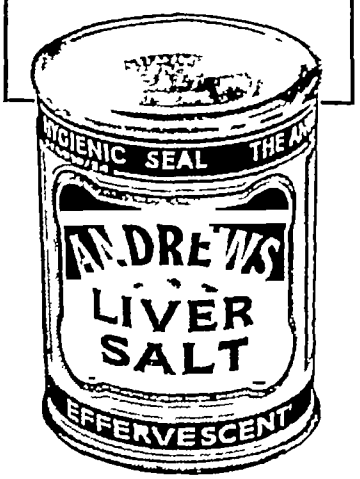
(*a*) *From Pernicious Anaemia*—The non-obstructive type of cancer of the body gives rise to symptoms closely simulating those of pernicious anaemia There is the same lemon-yellow pallor, shortness of breath, and loss of energy In pernicious anaemia, however, there are rarely such pronounced feelings of epigastric discomfort after food, and hardly ever is there the rapid loss of weight that occurs in cancer Yet cases frequently occur in which the diagnosis can only be settled by x ray and blood examinations

(*b*) *From Simple Ulcer*—We have seen how closely cancer may simulate simple ulcer, particularly when it is slow-growing and at the pyloric end If an x ray shows that the lesion is on the duodenal side of the pyloric ring we can dismiss the fear of cancer, for cancer hardly ever occurs in the first part of the duodenum, and gastric cancers never spread over the pyloric barrier into the duodenum The differentiation of cancer from simple gastric ulcer is, however, much more difficult In view of the site of election of the two conditions, an ulcer in the prepyloric region must be regarded with considerable suspicion, and if after two or three weeks of strict medical treatment occult blood is still found in the faeces it is not wise to delay surgical measures Even on the part of the lesser curvature specially liable to simple ulceration the x-ray appearances may be most misleading, as in the following case

A lady aged 60 consulted her doctor with vague indigestion pains of very short duration and some loss of weight She had never suffered from indigestion before A radiograph

ANDREWS LIVER SALT

combines the laxative action of



MAGNESIUM SULPHATE

with the pleasing qualities of an

EFFERVESCING SALINE

A NEW FEATURE

Each tin of Andrews is now sealed by a patented damp-and dust proof Cellophane Cap, which maintains original Laboratory condition making a good product even better

An 8-oz Tin will be sent free, on request, to any member of the Medical Profession.

Scott & Turner Ltd
Andrews House
NEWCASTLE-ON-TYNE.

1 ANDREWS LIVER SALT is a pleasant tasting effervescent aperient with tonic properties Its laxative action is due to the presence of magnesium sulphate and other salts which, by their Osmotic action, induce the flow of water through the bowel wall from the surrounding tissues In this way, the walls of the bowel are thoroughly cleansed, and its contents are maintained in a semi fluid condition, thus ensuring an easy painless evacuation

2 By removing from the system the poisonous waste food substances which slow down the digestive process and impede the action of the liver, ANDREWS acts as a tonic to the whole system and is a valuable aid in maintaining perfect fitness

3 ANDREWS stimulates the flow of bile and thus assists in the later stages of food assimilation and in destroying the toxins of faecal stagnation

4 It is antacid in action, and the carbon dioxide which is liberated when ANDREWS is dissolved in water has a sedative effect on the stomach and a physical cleansing action on the stomach walls It is, therefore, valuable in cases of indigestion, sickness and sick headaches

5 Rheumatism, when due to bowel sepsis, may be safely treated with ANDREWS LIVER SALT and the treatment of all forms of this disease is assisted by the effective bowel evacuation induced by ANDREWS.

6 It relieves headaches caused by excessive intercranial pressure, by reducing the amount of fluid passing through the brain

7 It may be used as a hydragogue purgative in the treatment of oedema, ascites, pleuritic effusions, and nephritis, and with safety even in failing cardiac conditions

8 In cases of fever, its brisk effervescing solution in water makes a refreshing and invigorating drink, quenching thirst, diluting the toxins, and relieving the strain upon the kidneys

9 It is useful in pharyngites and post nasal catarrh, dissolving secretion in the throat and clearing the stomach of discharges that have been swallowed

10 It may be taken with perfect safety by the most delicate adult or child, and may be confidently used in pregnancy where the stronger purgatives might be harmful ANDREWS does not produce any violent disturbance in the system, nor does it affect the secretion of milk

DOSE:—*as a laxative, the usual dose is two teaspoonfuls stirred into a glass of water and taken on rising in the morning or last thing at night, but this should be adjusted to individual needs and, in the case of children, graduated according to age*

MASTOID OPERATIONS

BY

WALTER HOWARTH, M A, M B, F.R.C S.
Surgeon to the Ear, Nose and Throat Department St Thomas s Hospital

AND

GEOFFREY BATEMAN, B M, F.R C.S.
Chief Assistant to the Department

Several different mastoid operations are in common use, and the object of this paper is to discuss these in order to estimate the value of and the indications for each There is little need to discuss acute infection of the mastoid When operation is indicated Schwartze's is the one almost universally performed There are many minor variations in technique, particularly in after-treatment, but we do not propose to consider these technical points

There is, on the other hand, much difference of opinion about the choice of operation for chronic otitis media The first point to be decided is whether one is necessary In the majority of cases seen in hospital practice the patient has had little or no previous treatment for his otorrhoea, and it is usually impossible at the first visit to say whether he will require operation We make it a rule to give these patients adequate conservative treatment and to observe the results of this before coming to a decision Adequate conservative treatment consists merely of aural hygiene The ear is syringed daily with normal saline, and spirit drops are instilled When the ear is cleaned up by this method granulations may be cauterized with silver nitrate, and accurate observations of the state of the middle ear and hearing can be made An appreciable number of the cases of chronic otorrhoea are cleared up in this way, but if after six weeks there is no improvement and no need arises for some simple operation such as the removal of adenoids or tonsils, then a mastoid operation is advised.

The objects of a mastoid operation for chronic otorrhoea are (1) to make the patient safe as regards intracranial complications, such as extradural abscess, lateral sinus thrombosis, meningitis, brain abscess, and facial palsy, (2) to preserve the hearing, (3) to cure the otorrhoea, (4) to avoid the necessity for prolonged supervision

Clearly the most important aim is to make the patient safe The radical mastoid operation, which was for many years almost universally employed in this clinic, achieves this, but only by sacrificing objects (2) and (4), and often (3) as well We were therefore stimulated to find some alternative, and the conservative method used by many surgeons seemed the ideal operation, provided that the claims made for it were verified With the view of finding to what extent it achieved the objects just set out, and to discover, if possible, any contraindications to it, we decided for a definite period to treat all cases of chronic otorrhoea under our care at the hospital by the conservative method, with or without a muscle graft The cases were therefore consecutive ones and not selected in any way

Conservative Mastoid Operation

The technique consists in exposing the mastoid antrum and clearing out the diseased mastoid air cells The aditus is enlarged by removal of the outer wall of the attic The incus can then be seen, and this is also removed The bony posterior meatal wall is left The skin is sewn up a small corrugated rubber drain being inserted in the bottom of the wound A modification is to turn down a flap of temporal muscle on an anterior pedicle so as to obliterate the cavity If this procedure is employed the wound is sutured without drainage

A third method which we have used on rare occasions deserves mention, as we feel that it has its place in the surgical treatment of chronic otorrhoea The bone surgery is done as before, but at the end of the operation the wound is left open and packed The meatus and the wound are then syringed daily with a mild antiseptic, 1/2 per cent eusol, and in two or three weeks the ear will probably be dry The post-auricular wound can then be closed with a temporal muscle flap if, as often happens, the bone does not granulate quickly This operation is not included in our series, as the cases in which it was employed are too few

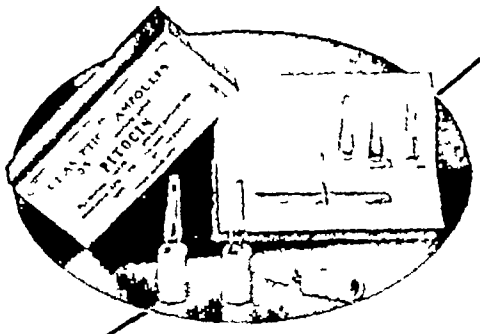
For over two years we aimed at using the conservative mastoid operation in all cases of chronic otorrhoea which needed surgery There were, however, cases in which the disease was so gross that this method would obviously have been valueless and others in which a previous operation had rendered it impracticable, these were treated by the radical mastoid operation During this two year period eighty-three conservative mastoid operations were performed In thirty-six of these cases the middle ear became dry and the patients were rendered symptom free, except for a varying degree of deafness, though on the whole the hearing is very good after a conservative mastoid operation In twenty-five cases some discharge from the ear continued, but this appeared to come only from the middle ear, and it seemed unlikely that any further operation would be necessary Seventeen cases have needed a further operation because the discharge persisted and alarming symptoms developed The remaining five have a persistent discharge and, in our opinion, will require further operation before the ear is in a satisfactory condition Thus, in eighty-three cases there were thirty-three successes (43 per cent), twenty-five qualified successes (30 per cent), and twenty two failures (27 per cent)

These results show a good proportion of successes, but the failures have made a great impression on us, as at the second operation it was usual to find a large suppurating cavity in the mastoid high up in the region of the tegmen antri and roof of the aditus, very often with the dura forming one of the walls of the cavity The dura is then thickened and covered with granulations, and the patient is potentially in a dangerous condition These findings have been very constant in the cases which have been reopened, and are most disquieting Some of the cases requiring a second operation had been dry before they started to discharge again This brings all cases under suspicion for a time, and we cannot feel entirely satisfied even with those which have ceased to discharge Of the seventeen cases operated on a second time eleven have had a radical and six a modified radical operation

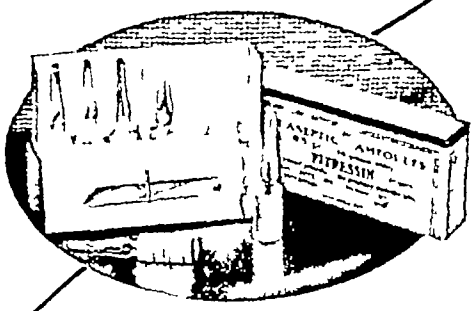
We therefore reached the conclusion that the conservative method was not suitable for all cases of chronic otorrhoea requiring operation As, however, 43 per cent did become symptom free with a dry ear it appeared to be a good operation provided some criteria for the selection of cases could be found

Analysis of the Cases

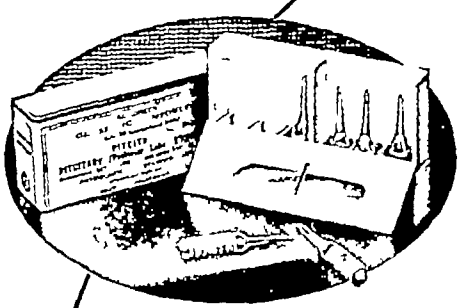
Analysis does bring forward some factors common to the successes and common to the failures



Hearing—On the whole the successful cases heard well, some successes had poor hearing whereas in some of the worst failures, with attic cholesteatoma, it was very good



Pituitary Products



'PITUITRIN'—the first posterior-pituitary extract to be placed at the disposal of the medical profession—was introduced in 1908 and is still the premier product of its class

Parke Davis, & Co's experience in this connection is unique and enables them to offer preparations that are unsurpassed for uniformity of strength reliability of action and freedom from excess proteins

Parke, Davis & Co's research workers showed in 1927 that there are at least two active principles in 'Pituitrin' These are now available in 'Pitocin' (the oxytocic principle), and 'Pitressin' (the pressor and antidiuretic principle)

'PITUITRIN' is standardized to contain 10 International units of oxytocic activity per c c, it is standardized also to contain 10 pressor units per c c

'PITRESSIN' is standardized to contain 20 pressor units per c c It is indicated for controlling the polyuria of diabetes insipidus for the relief of post-operative intestinal stasis and for the prevention of post operative shock and collapse It has also proved of great service in the elimination of gas-shadows in abdominal radiography

'PITOCIN' is standardized to contain 10 International units of oxytocic activity per c c, it is indicated as a stimulant to the uterus in labour when the uterine contractions are inadequate, especially when an increase in blood pressure is undesirable, as in eclampsia

DISSEMINATED FOCAL PNEUMONIA

BY

J G. SCADDING, M D , M R C P.

First Assistant Department of Medicine British Post-graduate Medical School

(WITH SPECIAL PLATE)

Cases conforming to the classical descriptions of pneumonia comprise only a proportion of the total number of acute pulmonary infections While lobar pneumonia has been studied extensively, and detailed experimental investigations have been made into the various bacteriological types of pneumonia, the atypical pneumonias which are of such importance to the clinician are as yet largely unclassified It has been the observation of many that such cases are becoming relatively more numerous , this point is stressed in a recent study by Olmer *et al* (1936) Allen (1936) has described a relatively benign form of pulmonary infection which he has studied radiologically and termed "acute pneumonitis' I wish to draw attention to some cases of acute or subacute pulmonary infection which seem to form a recognizable clinico-radiological group, important on account of the unusual and possibly prolonged course and the resemblance of the radiological changes to those of pulmonary tuberculosis

Case I

A man aged 25 a carpet planner was first taken ill on August 27 1936 with malaise, frontal headache, backache, pain below the left clavicle, and two mild shivering attacks He took to his bed in two days he attempted to go back to work, but had to return home He developed a slight cough, with scanty expectoration He had had no serious illnesses previously and his family history revealed nothing of note

On admission to hospital on September 3 he was drowsy and flushed and complained of frontal headache Temperature 102 2° F, pulse 102 respirations 18 The tongue was furred and fauces injected The chest showed some diminution of movement on the left side with impairment of percussion note over the upper half especially anteriorly Over this area a few medium rales were audible the breath sounds were vesicular Examination of other systems showed nothing abnormal The course of the pyrexia is shown in Chart 1

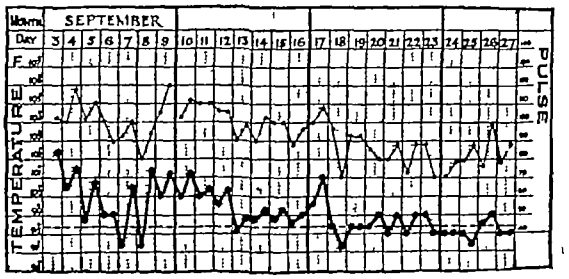

CHART 1 —Showing course of the pyrexia in Case I

For the first few days prostration continued and there was much sweating the respiration rate remained at or below 20 per minute until September 9 when it rose to 30 and then ranged between 20 and 30 for a week A skiagram of the chest on September 8 (Plate Figs 1 and 2) showed extensive mottling in the upper and middle zones of the left lung, suggestive of tuberculous infiltration

At this stage pulmonary tuberculosis was suspected and the advisability of pneumothorax treatment discussed but it was decided to await bacteriological confirmation The sputum at first scanty and muco purulent gradually became more profuse and purulent reaching a maximum of 120 c cm on September 17 The pulmonary physical signs at the left upper zone extended somewhat at first, and generalized rhonchi were occasionally heard Hoarseness of the voice was noted on September 6 Mr J I Griffiths reported a simple laryngitis on September 14 By September 22 the temperature was settling rales were still audible over the left lung, but the percussion note was less impaired A skiagram on this date showed some resolution of the mottling By October 5 there was very marked improvement sputum was reduced to a trace *On account of some* nasal obstruction the nasal sinuses were investigated , the left antrum was somewhat opaque but on puncture only debris resulted On October 9 a skiagram showed only slight relative want of translucency in the left upper and middle zones

The patient was discharged on October 21 and was seen again a month later feeling quite well, the only residual symptom being cough with some mucoid expectoration.

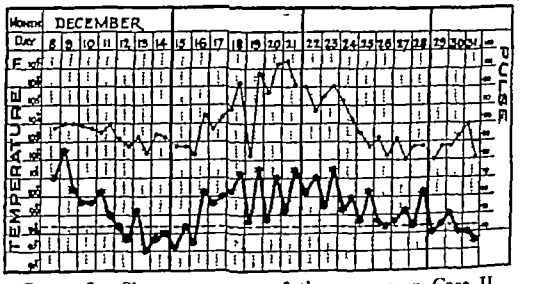
LABORATORY EXAMINATIONS

The sputum was examined five times for tubercle bacilli with negative results Mouse inoculation on September 4 failed to show pneumococci Culture on September 23 gave a growth of *H influenzae Strep viridans* and *N pharyngis* A blood examination on admission showed a normal red-cell count, and 9,400 leucocytes per c mm , of which 48 per cent. were polymorphs The maximum leucocyte count recorded was 14 000 per c mm with 70 per cent polymorphs on September 15 Agglutination tests for the typhoid group and *Brucella abortus* were negative on September 18

Case II

A man aged 27, a motor assembly engineer was taken ill on December 2 1936 with malaise and shivery sensations, and had to return home from work The next morning he felt better and went to work but felt so weak with headache, cough, and feverishness that he went home again to bed In *the succeeding days he had a troublesome unproductive* cough excessive sweating day and night some dyspnoea but no pain and he vomited once His previous health had been good apart from an attack of pneumonia at the age of 8 years His mother had died of pulmonary tuberculosis

The patient was admitted to hospital on December 9 he was rather thin, looked ill and pale, sweated freely, but there was no cyanosis Temperature 101° F pulse 98 respirations 28 There was slight faucial injection The chest was moving less on the right side and the percussion note was slightly impaired over the lower half of the right lung The breath sounds were vesicular on the left side with a few rhonchi at the base on the right they were weak with many scattered rhonchi and medium rales *below the angle* of the scapula Examination of other systems showed no abnormality The course of the pyrexia is shown in Chart 2



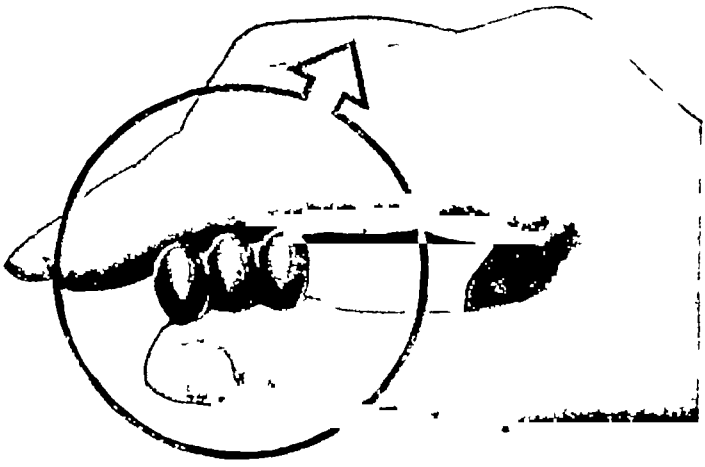


CHART 2 —Showing course of the pyrexia in Case II

For the first few days after admission the temperature fell, though there was little change in the symptoms Sweating was noted to be extraordinarily profuse Small amounts of purulent sputum were produced, once slightly blood stained The rales on the right side extended upwards to below the clavicles

A skiagram on December 10 (Figs 3 and 4) showed wide spread coarse mottling of the right lung most dense in the

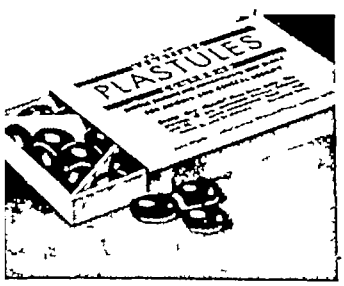
3 PLASTULES' are equivalent to 18 x 5 grain Blauds Pills 19 x 5 grain Capsules of Reduced Iron 20 x 7½ grain Capsules of Iron and Ammonium Citrate

AN ADVANCE IN IRON THERAPY

'PLASTULES are prepared from Ferrous Sulphate a readily assimilable form of iron, the action of which is potentiated by concentrated yeast

PLASTULES with Liver Extract are fortified with additional anti anaemic factors

ADVANTAGES OF 'PLASTULES'



(1) Effective in small doses which are equivalent in therapeutic value to large doses of other forms of Iron

(2) Economical Small doses and low initial cost

(3) Convenient Soluble oval-shaped elastic capsules

(4) No Gastric Disturbances—which frequently result from taking large doses of Iron

JOHN WYETH & BROTHER LTD.
25, OLDHILL PLACE, LONDON, N 16

with normal recovery On October 7 a lipiodol examination showed no gross abnormality there was slight cylindrical dilatation of the posterior branches of the left descending bronchus

Though the general condition was still far from satisfactory he was discharged from hospital on October 9 at his own request

LABORATORY EXAMINATIONS

The sputum was examined for acid fast bacilli five times, with negative results On August 26 culture yielded *Strep viridans Strep non haemolyticus N pharyngis* and *M tetragenus* A blood examination on August 24 showed 6 000 leucocytes per c mm., with a normal differential count

On November 12 he was admitted to St. Charles' Hospital on account of vomiting, dysphagia, and loss of weight, of ten days duration A laryngeal palsy developed, dysphagia was progressive and it became clear that these symptoms were due to a lesion of the central nervous system A skiagram of the chest taken on November 16 showed changes similar to those in Fig. 9 but somewhat obscured by lipiodol residues

He died on November 28 A necropsy was carried out by Dr A B Bratton The immediate cause of death was a bulbar encephalitis probably polio encephalitis with peri vascular cuffing" focal degeneration of nerve cells and small areas of softening and of haemorrhage in the medulla, pons and mid brain The changes in the lungs were described as follows

On removal the lungs were unusually firm, somewhat suggesting red induration, and there was consolidation at the right base On microscopical examination a section from the right lower lobe shows an ill-defined area of organizing pneumonia in the rest of the section there is chronic interstitial inflammation and slight fibrosis of the alveolar walls, and oedema and recent haemorrhage in the alveoli A section of another part of the lungs shows oedema and congestion, and a focal but widespread distribution of slight fibrosis and slight chronic inflammatory infiltration of the alveolar walls There was no evidence of tuberculosis"

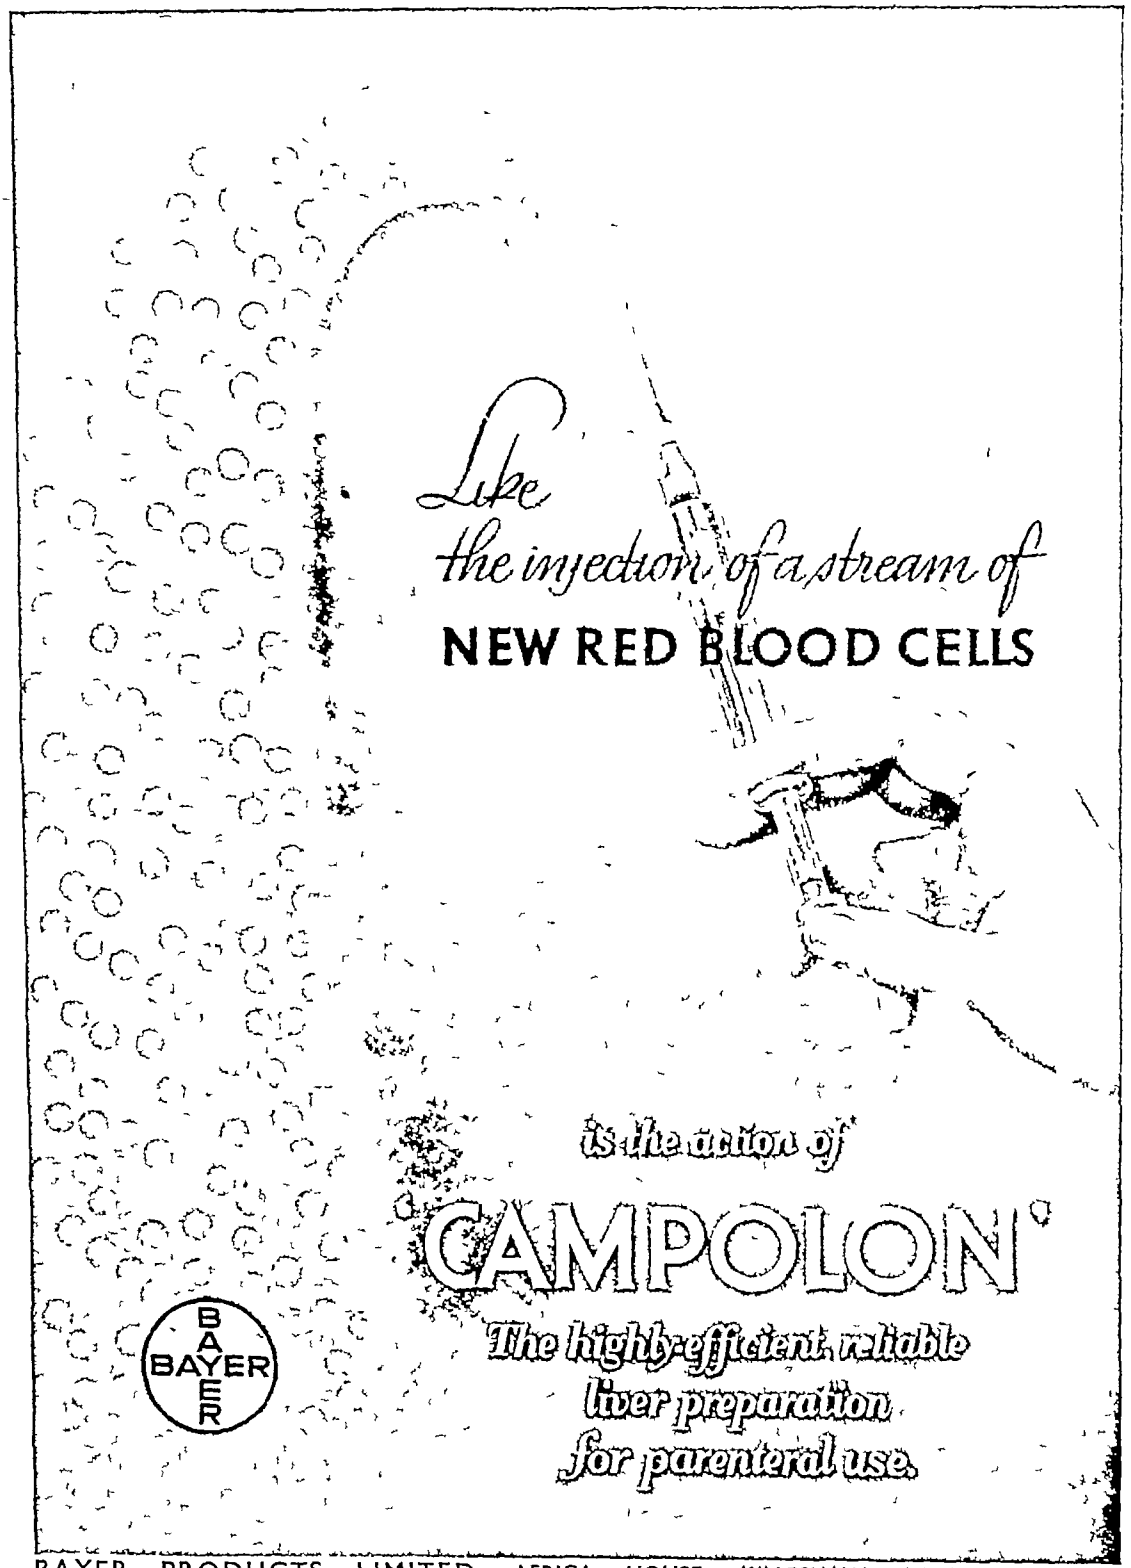
Nature of the Pulmonary Lesion

The clinical and radiological evidence suggests that the pulmonary lesion in these cases was essentially a pneumonia in small foci disseminated through lobes or parts of lobes of the lungs, and liable to enter on a phase of delayed resolution The pathological evidence in Case IV—'focal but widespread distribution of slight fibrosis and slight chronic inflammatory infiltration of the alveolar walls'—lends support to this view This pathological picture has distinct affinities with that observed in three more chronic cases which terminated fatally, recently reported (Scadding, 1936) In these a pulmonary infection of subacute or chronic course closely simulated pulmonary tuberculosis, both clinically and radiologically at necropsy the chief finding was a simple pneumonia in diffuse foci showing recent consolidation, resolution, organization, and suppuration The lesions in the two series seem essentially similar, those of the present series undergoing resolution at an earlier stage and showing less tendency to progress to the more chronic phase of organization and fibrosis

Thus there arises the concept of a process characterized by pneumonic consolidation in small scattered foci, the individual foci at any time may be of different ages and at different stages of evolution towards resolution, organization, or suppuration They may clear almost completely or may leave more or less residual fibrosis The process shows little of the tendency to a clear-cut termination seen in the more usual types of pneumonia, and may enter a subacute or chronic phase Clearly, if a case presenting this picture comes to necropsy there will be little that is striking to the pathologist except the focal distribution of the lesions, the main interest of the picture is clinical As a clinically convenient term, not involving any aetiological assumptions, I propose to describe the condition as "disseminated focal pneumonia"

Clinical Picture of Disseminated Focal Pneumonia

The symptoms differed clinically from those of other forms of pneumonia in several important respects The onset was not sudden as in lobar pneumonia, and there was no evidence of a previous descending respiratory infection as in some of the commoner forms of bronchopneumonia The initial symptoms were mostly constitutional—malaise, headache, sweating, and shivery sensations short of an actual rigor While there was some dyspnoea there was no respiratory distress at rest Pain in the chest was not a prominent symptom, it was entirely absent in two cases, and in the other two was not of typical pleuritic type Cough at the onset was dry The course was subacute or chronic, and fever variable, not sustained, terminating by an indefinite lysis, and in the more chronic cases amounting only to an inconstant evening rise Sweating became a prominent symptom The cough, at first dry, subsequently became productive of increasing amounts of purulent sputum, reaching a maximum after several weeks, and continuing thereafter according to the progress of the case Defervescence occurred in the fourth or fifth week in the two more febrile cases in which the whole course was observed and symptoms, especially cough and sputum, continued for another week or two In the two less acutely febrile cases symptoms continued for a longer time after the temperature was normal If the cases in my previous series be accepted as belonging to the same category the possibility of a chronic progressive course must be recognized



The physical signs were most evident over the upper lobes in two cases and over the lower lobes in two They consisted of moderate impairment of percussion note, weak breath sounds, and numerous fine to medium rales No definite consolidation signs were detected

Radiologically the picture consisted of areas of diffuse rather coarse mottling, in foci varying from about 2 to 5 mm in diameter These changes were confined to the left upper lobe in one case and affected parts of more than one lobe in the rest Resolution was slow in all but one case, in one it was not complete for at least twelve weeks from the onset The resemblance of the infiltration to that of tuberculosis was at times striking

Aetiology

The most remarkable feature of the bacteriology of the sputum in these four cases was the absence of organisms usually associated with pneumonia in two the result of culture was confirmed by a negative result from mouse inoculation Only organisms which might be found in any respiratory tract were isolated *Strep viridans N catarrhalis* micrococci, and diphtheroids, and in one case each *H influenzae* and *H para influenzae* In no instance was there evidence of a fungus infection, and the presence of tubercle bacilli was excluded by repeated direct examination of the sputum, and in one case by guinea-pig inoculation

The question of an influenzal aetiology arises but there was no epidemic prevalent at the time of onset of any of these cases, nor was there any illness among contacts, and when an epidemic of proved virus influenza

*Northern Office (Information only) BLACKFRIARS HOUSE, PARSONAGE, MANCHESTER

injection of perchloride of iron into the cyst effected a cure From the description this must have been in the nature of a haemangioma rather than a true varix Bennet (1890) describes two cases One was that of a girl aged 5 who had a small, flattened, softish tumour over the middle of the left sterno mastoid to the outer side of the external jugular vein, with which it was pretty obviously connected This showed the usual signs of purplish colour and an increase in size during laughter, crying, or on exertion The second case was that of a man aged 41 who complained of a tumour over the right sterno mastoid, partly overlapping the external jugular vein If the patient held his breath or compressed the vein on the proximal side the swelling became much more prominent More recently Sussig (1923) and Biesenberger (1928) record cases The cyst described by Sussig was attached to the internal jugular vein by a small venous stalk about the size of a match-stick In the case reported by Biesenberger the condition had been present for ten years in a young woman of 22 The swelling in the neck appeared on exertion, but had always disappeared again, either of its own accord or after slight compression The patient eventually came for treatment because after lifting a sheep the swelling had persisted In this case the cyst was so closely attached to the external jugular vein that this vessel had to be ligated Jura (1935) reports two cases and gives a very full review of the literature

Jura's Cases

Case 1—The patient a woman aged 45, noticed a swelling in the right side of the neck one year before she came for treatment. The lump was then about the size of a hazel nut, but had increased until it reached the size of a pigeon's egg During forced inspiration the external jugular vein was clearly defined entering at the superior and leaving at the inferior poles of the tumour The swelling which had a smooth surface, was of soft elastic consistency and disappeared on pressure It was non pulsating and painless By exploratory puncture blood of a venous character was withdrawn On operation it was found that the tumour was attached to the external jugular vein and it was therefore necessary to ligate the vein above and below the cyst This was loculated and filled with partly liquid and partly coagulated blood Sections of the tumour showed organizing clot, though portions had the characteristics of a simple haemangioma

Case 2—This patient, a girl aged 11, complained of a swelling in the right side of her neck Over the external jugular vein was a pyriform tumour which increased in size on forced inspiration From the margins of the tumour particularly on its anterior and inferior aspect numerous dilated veins emerged No pulsation was present in these veins which disappeared on pressure At operation the external jugular vein and the numerous vessels proceeding from the varix had to be ligated The cyst contained fluid venous blood Jura considers this swelling to have been a dilatation of the external jugular vein at the point at which it is joined by the transverse anastomotic veins from the opposite side Microscopically venous structure was found in sections of the cyst wall with here and there noticeable thickening of the intima and lymphocytic infiltration of the adventitia

Report of Present Case

A boy aged 13 complained of a small lump above the clavicle on the right side The swelling was first noticed by his mother about three months before Since then the lump had remained much the same size It was painless and appeared to grow larger when the boy talked much or shouted

On examination a small bluish rounded swelling was seen about one inch above the right clavicle lateral to the sterno mastoid It was tense fluctuant not adherent to the deeper structures, and freely mobile from side to side but limited vertically On compression a smaller swelling appeared a quarter of an inch above the upper border of the original tumour When the patient held his breath the swelling grew to about twice its former size It seemed to pass beneath the clavicle along the course of the external jugular vein No pulsation was present and nothing could be heard on auscultation The heart and lungs were normal

At operation a small almond shaped swelling the colour of black currant jelly, lying in the subcutaneous tissues, was excised A fine stalk connected it to the external jugular vein The contents of the cyst were partly blood-clot and partly some solid material

The pathological report was Sections show old and recent blood-clot with blood pigment in various places In the centre is an area of granulation tissue with young fibroblasts, young blood vessels, and small round cell infiltration Scattered through the section are numerous giant cells These appear to be of the foreign body type Section of the venous stalk shows a much collapsed vein capable of considerable distension The walls of the vein are unusually vascular'

Discussion

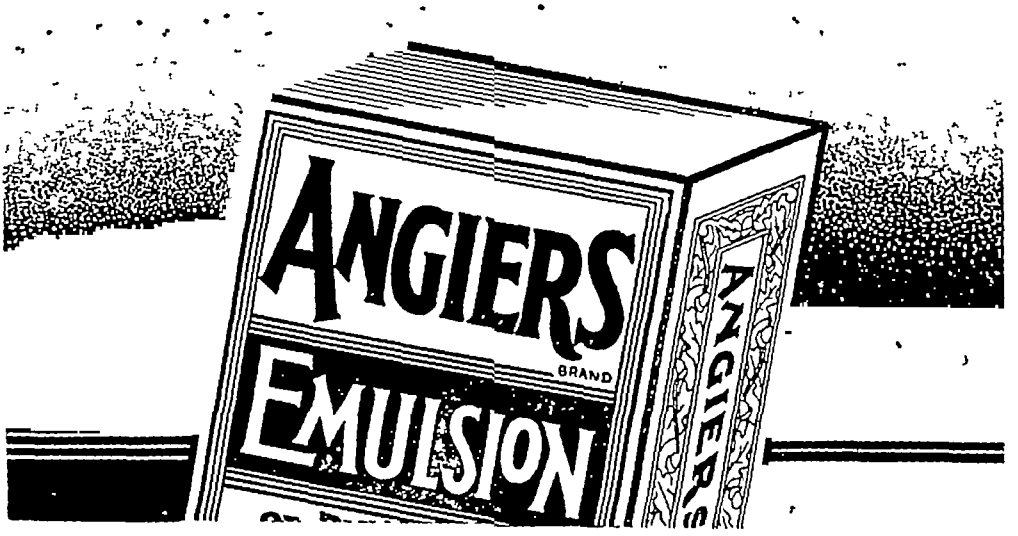
A most comprehensive survey of this condition is made by Guibal (1903), and I have used his paper in this discussion The time of appearance varies considerably, from a few weeks after birth to middle age The frequency of the condition in early life, however, favours the congenital origin of these cysts In those cases which go on into middle age the cyst is probably of the type recorded by Biesenberger (1928), in which the swelling appeared on exertion but disappeared again spontaneously, though undoubtedly some of these are acquired Jura (1935) is of opinion that the majority of those appearing in later life are acquired

The pathology presents some points of interest Paget (1853) mentions sanguineous cysts and describes, among others, one type as 'of proper origin" which seems to be very similar to the varices described above Some authors (Sussig, Biesenberger, Jura) have noted the presence of atrophic smooth muscle fibres, probably part of the degenerated venous musculature The contained blood clot in all cases showed evidence of organization, and the resulting formation of a network of capillary vessels had some characteristics in common with simple angiomata In no case from the literature was the presence of giant cells recorded, the significance of which it is difficult to determine

Generally it is only by chance that the cervical swelling is discovered by the parents Neither pain nor discomfort is usually caused by the swelling, and compression symptoms even in very large varices have never been reported More rarely definite symptoms may occur, such as pain on exertion or on moving the head, tinnitus and vertigo on stooping In size these swellings vary from that of a hazel nut to an orange, though Guibal mentions that in extreme cases the whole side of the neck may be occupied by the tumour Their shape is generally pyriform, the surface is smooth or may give the impression of lobulations The limits are easily defined, and the vein can occasionally be palpated entering and leaving the swelling (Jura) The skin is bluish in colour and freely mobile These signs may be modified by the depth of the tumour On palpation the swelling is tense, frequently fluctuant, and non pulsating Pressure will reduce it, and on relaxing the cyst refills Violent expiratory movements cause the tumour to increase in size to twice or thrice the normal Wolff (Guibal) records a case in which the tumour became more prominent as a manifestation of the patient's annoy-

The Emulsion for Children

In many of the wasting diseases of childhood, a sensitive, irritable stomach and intestines preclude proper nourishment



Under the administration of 'Angiers' these organs become pacified and retentive, digestion is strengthened, and the assimilation of food is normal and complete It is oftentimes surprising how quickly pale, flabby, weakly infants and children gain flesh, strength and vitality when they are given the Emulsion systematically

We confidently urge its trial in marasmus, scrofulosis, inherited tuberculosis, anæmia, and in the malnutrition associated with acute infectious disease It is likewise one of the most useful and dependable remedies for the treatment of bronchitis, whooping cough and the respiratory affections associated with measles and scarlet fever

The pleasant, cream-like flavour of 'Angiers' and its ready miscibility with milk or water, make it eminently suitable for administration to children

and the gastro intestinal tract was normal. In the right iliac fossa was a large mass of tumour tissue which was infiltrating the psoas muscle. The right ureter ran through this mass. Section through the tumour showed it to be composed of white tumour tissue showing areas of necrosis at places. The tumour tissue had a radiate appearance which started from a point in the ureter just above where it crossed the pelvic brim. In an upward direction the wall of the ureter was involved to a point 3 cm. from the pelvis, and in a downward direction to very near the opening of the bladder. In spite of the extensive ureteric involvement in an upward and downward direction from the primary focus there was no obstruction of the tube, and the renal pelvis showed no dilatation. The kidney on the affected side contained two nodules of tumour tissue in its substance, each slightly smaller than a pea (see Plate). The left kidney was normal. The para-aortic glands were fairly extensively involved by secondary tumour growth. The fourth and fifth lumbar vertebrae also showed invasion by tumour tissue.

Sections of the ureter and kidney were examined histologically. The tumour was found to involve the whole thickness of the ureter and to spread for some distance outside this at its point of maximum growth, but even here the remains of circular muscle and fibrous tissue were present, thus preserving the tube-like appearance. The mucous membrane was replaced by ulcerated tumour tissue. The tumour cells were rather small and were spheroidal in shape. Here and there a multinucleated cell was apparent. The tumour had a definite alveolar arrangement and was obviously a papillary type of carcinoma, resembling that got in the renal pelvis.

Commentary

The case described presents some interesting features.

1. *The Absence of Obstruction of the Ureter*.—A tumour growing outside the ureter and pressing on the tube very readily causes obstruction with secondary hydronephrosis. A primary carcinoma of the ureter apparently in many cases does not do this (McCown, 1930). In our case signs of obstruction were absent or slight. Examination of the specimen readily showed why this was so. The tumour was seen to be growing outwards in a radiating manner from its focus of origin, and in this way appeared actually to hold the tube open instead of obstructing it. Moreover, a carcinoma growing from outside the ureter compresses it for a time before actually infiltrating it, whereas a primary carcinoma of the tube early ulcerates into its lumen, and necrotic cells on the surface are liable to be washed down with the efflux of urine. The growth of tumour for some distance upwards and downwards along the ureter should also be noted.

2. *The Absence of Urinary Symptoms*.—This absence of symptoms is well known, and in many of the cases reported in the literature the diagnosis of renal disease was not suspected before the necropsy (McCown, 1930). This lack of symptoms is associated in many cases with the absence of obstruction of the tube. The absence of even haematuria was a notable feature in the present case. This has also been noted by other writers (Wising and Blix, 1878, Adler, 1905, van Capellen, 1916, Hektoen, 1896, Toupet and Guéniot, 1898).

Summary

The case of carcinoma of the ureter showing some interesting features is described, and others in the literature are summarized.

My thanks are due to Mr. Milne McIntyre and to Professor J. S. Dunn for permission to use the clinical and pathological notes of this case.

SPONTANEOUS SUBARACHNOID HAEMORRHAGE

REPORT OF A CASE

BY

ABDULLA KARMALLY, M.B., B.S.,
M.R.C.P.Lond., F.C.P.S.Bom.
Honorary Physician Sir J. J. Hospital, Bombay

WITH

NOTES ON POST-MORTEM FINDINGS

BY

K. D. MANOHAR, M.D.
Pathology School, Grant Medical College, Bombay

(WITH SPECIAL PLATE)

Rupture of a congenital aneurysm has been recognized as an important and comparatively frequent cause of *spontaneous subarachnoid haemorrhages*, especially in young non-syphilitics. The subject has been studied in detail by Eppinger (1887), Fearnsides (1916), and several other workers. Forbus (1930) investigated the histological aspect in particular, and offered certain explanations on developmental basis.

The following case is described chiefly because a detailed post mortem examination was available and the histological studies showed certain differences in the structural changes from those described by Forbus.

Clinical History

A man aged 30, a hotel servant, developed a severe headache overnight. The next morning he felt giddy and fell down in a semi-comatose condition in the lavatory, when he was brought to the hospital.

On admission (March 27, 1936) the patient was dazed but answered simple questions in a slow thick voice. He complained of a severe headache, but otherwise felt well, though he had a sense of impending disaster.

On examination he was seen to be well nourished, with no marks of injury and material from gastric lavage showed no poison. Breathing was rapid and deep, and there was a definite rigidity of the neck and exaggeration of deep reflexes. Kernig's phenomena and the plantar reflex were equivocal and abdominal reflexes were present. Lumbar puncture brought out fluid under tension uniformly mixed with blood. No clot was found on keeping the supernatant fluid had a golden yellow colour. The pulse was slow—52 per minute—and full and the blood pressure 143/100. Heart sounds were normal.

Laboratory Examination.—The urine showed a fair amount of albumin but no casts, no red blood cells, no pus cells. Blood culture revealed no organisms. The blood count was normal, there were no malarial parasites, and Widal, Wasser mann and Kahn reactions were negative. The cerebrospinal

Cadburys have perfected a SPECIAL CHOCOLATE which is *Sugar Free and therefore a suitable addition to the dietary of diabetics

This chocolate is extremely palatable, and because Cadburys have unlimited facilities for laboratory research and the subsequent manufacture and marketing of such a product it sells at a very low price Further details and analysis with a sample of this Special Chocolate will be gladly forwarded to anyone interested Please write to Cadburys Laboratories, Bournville

★ *The main sweetening agent employed in the manufacture of this chocolate is d Sorbitol, a hexa-hydric alcohol which in clinical tests both at home and abroad has been proved suitable for diabetics*

the bronchi being dilated in the atelectatic lobe, as are the alveoli of the sound lobe, in an attempt to fill in the space left by the collapsed lung tissue

Recognition of the Association of Atelectasis and Bronchiectasis

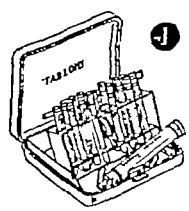
As Findlay points out, this mode of production of bronchiectasis has been recognized for over a hundred years, but the ocular proof of the association was not given until, in 1926, Singer and Graham with lipiodol radiographs demonstrated bronchiectasis within triangular basal lung shadows These shadows were proved at operation to be those of atelectatic lower lobes, and their presence is now accepted as suggestive evidence of bronchiectasis This work has since been many times confirmed, notably by Warner and Graham (1933), who found that the bronchiectasis was usually of a cylindrical type Both lower lobes and right middle lobes were liable to be involved Often the bronchiectasis was seen in the early stages of atelectasis—for example, six weeks from its onset—and pathologically in this instance and in other cases no pulmonary fibrosis was found These writers discovered bronchiectasis in all the triangular shadows which they investigated, but W E Anspach (1934) found no bronchiectasis at necropsy in a few infants with atelectatic lower lobes He also failed to find bronchiectasis in certain adults whose atelectatic lower lobes had re-expanded He regarded the atelectasis as the forerunner of bronchiectasis in all cases, and emphasized the factor of inspiratory pull in producing the bronchial dilatation All modern writers agree in describing the atelectasis as usually an acquired condition (Jones and Cournand, 1933) Bronchiectasis in an atelectatic lobe must be distinguished from congenital cystic disease

It is probable that a cylindrical dilatation of bronchi will occur during life in all atelectatic lobes of the type described That Anspach failed to demonstrate it in infants after death is accountable by the fact that the tension exerted during life was no longer present at the time of his observation The case reported by Fletcher and Dimson (1935) as showing no bronchiectasis in an atelectatic left lower lobe does not appear to have any lipiodol in the bronchi of the atelectatic lobe, according to the picture which they reproduce

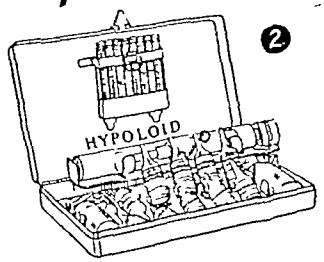
Bronchial dilatation has been reported by Boyd (1935) fourteen days after the occurrence of atelectasis, and probably it could be demonstrated almost from the onset of collapse Neither Boyd nor Scott Pinchin and Morlock (1930) considered the possibility of recovery from a demonstrable bronchial dilatation The last two writers diagnosed a triangular basal shadow as representing fluid because after its disappearance no bronchiectasis remained

Possibility of Disappearance of the Bronchiectasis

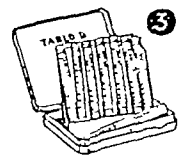
It has been established that bronchial dilatation may be present in an atelectatic lobe without any fibrotic lung change and without any marked change in the bronchial wall The transience of atelectasis was radiologically demonstrated, notably by Anspach (1934) and by Sparks (1931) In Anspach's cases no bronchiectasis remained after re-expansion, but that it had been present was neither proved nor thought likely In Sparks's cases bronchiectasis persisted after re expansion Not until 1935 was the transience of bronchiectasis demonstrated, and then in two cases Findlay showed that when the atelectatic lobes re-expanded the compensatory bronchiectasis within them disappeared His cases were both in children As the importance of his observations would still seem often to be overlooked the following striking case of the same type in an adult is quoted



Case Report



A man of 35 years, a labourer, gave a history of "pneumonia" two years and four years before admission These attacks did not appear to have been severe, though the patient's memory was not good enough for him to give accurate details It seemed possible that the attacks were of a similar nature to the present one A week before admission he was seized with a pleuritic pain at the base of the left lung He felt quite well apart from the pain and a troublesome dry cough On examination he was high-coloured and slightly cyanosed, with dyspnoea and a respiratory rate of 30 Temperature was 102° and the pulse rate 100 A Harrison's sulcus was present, more marked on the left side of the chest, and this side showed restricted movement At the left base posteriorly there was a triangular area of dullness in which the breath sounds were bronchial in character In this area, and in both lower zones generally, numerous rales occurred There was some pleural friction in the left axilla For the next week the patient showed a gradual diminution of fever, and he was apyrexial on the eighth day after admission Cough produced from one to three ounces of thick yellow sputum daily for the first eight days, and the amount then rapidly decreased No tubercle bacilli were present Radiographs of the chest soon after admission revealed a triangular basal shadow on the left side, reported by Dr Duncan White as "extremely suggestive of atelectasis of the left lower lobe" (Plate, Fig 1) Breathing exercises were started on the twelfth day after admission On the eighteenth day the patient was symptom-free, but the signs of atelectasis persisted, though there was now a smaller area of dullness and less marked bronchial breathing A lipiodol radiograph taken at this time revealed cylindrical dilatation of the bronchi of the left lower lobe (Fig 2) Five days later the left lower lobe appeared clinically almost entirely to have re expanded This was confirmed radiologically ten days after the first lipiodol injection The bronchi were reinjected at the same time and showed no dilatation. The patient was discharged, and when seen recently (over four months after the onset of his illness) was quite well and had no chest signs A third lipiodol radiograph (Fig 3) confirmed the previous finding of a normal bronchial tree



Conclusion

A patient is described who in the course of an attack of severe acute bronchitis, with probably small areas of bronchopneumonia as well, developed an atelectasis of the left lower lobe This quite possibly was due to plugging with secretion of the bronchioles in that lobe during a time when movements of the left lung were restricted on account of pleuritic pain At all events, when sputum was coughed up later the lobe re expanded In this process it was assisted by respiratory exercises A cylindrical dilatation of the bronchi developed within the collapsed lobe With re-expansion of the lobe the bronchi became of normal width, as demonstrated by lipiodol injections As nearly as can be estimated the lobe was collapsed for a month The case described, like those of Findlay, illustrated the possibility that bronchial dilatation in atelectatic lobes may disappear if the lobe re expands For this reason it is urged that methods for promoting early re expansion of atelectatic lobes should be employed Among these, postural and bronchoscopic drainage inhalation of CO_2, and respiratory exercises have all been used with success Not until such methods

A Case of Rupture of the Aorta

The interest of this case lies in the rarity of the condition and the diagnostic difficulties which it presents, and in the absence of any obvious cause

CASE RECORD

I was called at 1 o clock one morning to see a married woman aged 63, she gave the following history Her last meal had been at 8 o clock the previous evening, and she went to bed at 10 p m feeling quite well She awoke at 12 o clock, turned over in bed, and was immediately seized with acute pain in the epigastrium which passed through to the back and the region of the left shoulder-blade The pain was constant and very severe Vomiting occurred twice with no relief

On examination the patient was very pale her face was covered with perspiration and wore an anxious expression She was obviously in great pain but could move in bed and had tried walking about her room in an attempt to get relief There was acute tenderness on pressure in the epigastrium but no rigidity The heart sounds were rather weak, the area of cardiac dullness being slightly increased towards the left the apex beat could be felt half an inch outside the mid clavicular line The pulse was full and regular and the rate 50

The most probable diagnosis appeared to be a perforated gastric ulcer still in the latent period as regards physical signs The bradycardia was thought to be possibly due to reflex vagus stimulation This diagnosis was strengthened by the fact that I had operated upon her five years before for a pyloric ulcer the operation consisting of posterior gastro-jejunostomy embedding of the ulcer, and occlusion of the pylorus (her general condition at the time was too poor to justify more radical measures) She was therefore admitted to hospital as an emergency case A short period of observation sufficed to overthrow the original diagnosis No further abdominal signs developed The patient s condition became rapidly worse she was dyspnoeic and much distressed At 2 a m the pulse rate was 48 full and regular the cardiac signs were unchanged and the blood pressure was 140/70 At 7.20 she had an epileptiform convulsion and became unconscious Death took place fifteen minutes later

NECROPSY

Post-mortem examination revealed a clean transverse split involving the inner coat of the ascending aorta just above the semilunar valves and extending around two-thirds of the circumference The escaping blood had made its way between the inner and outer coats of the vessel (whether the media was split with the intima it was impossible to say), forming a dissecting aneurysm which extended to within an inch of the lower end of the thoracic aorta Secondary rupture had taken place into the pericardium, which was distended with blood clot Apart from one small patch of atheroma in the ascending aorta the vessel appeared to be perfectly healthy The coronary arteries were somewhat thickened There was no other sign of vascular disease

Thrombosis Complicating Hyperthyroidism

In view of the notes on a case of thrombosis of the subclavian vein complicating hyperthyroidism in the *British Medical Journal* of April 17, 1937, the following may be of interest

A married woman, aged 52 had for some years lived an invalid life, spending weeks in bed and rarely being able to carry out all her household duties When seen two years ago with Dr Foster of Churchdown she had the symptoms of toxic goitre dyspnoea palpitation sweating loss of weight, and slight general enlargement of thyroid, and her heart was fibrillating Rest iodine and digitalis had little effect.

When seen again on April 13, 1937 her general condition was worse her heart was enlarged and was fibrillating. On April 24 she was admitted to hospital and treatment with Lugol s iodine solution was started at once The following morning she complained of pain along the inner side of the right arm and axilla The right upper limb was swollen and tender on the inner side, with slight pitting on pressure The radial pulses were alike, there was no tenderness in the neck Her temperature which was 100 on the day of admission, never rose above 99 during the next four days, when it

became normal Her pulse, about 140 and irregular on admission dropped to just above 100 Digitalis was first given on the 28th The swelling of the arm increased for the first four days and then gradually decreased at the end of a fortnight all swelling and tenderness had disappeared On May 26 a subtotal thyroidectomy was performed by Mr Alcock of Gloucester On June 7 an electrocardiogram still showed the fibrillating heart (Fig 1) On June 10 quinidine was given for the first time and on the 12th the heart beat was regular. Fig. 2 shows the result on June 18

The patient made a good recovery, was able to go away for a real holiday, and has put on weight

CARCINOMA OF THE STOMACH*

BY

JOHN MORLEY, Ch M, F R C.S

Professor of Surgery Manchester University Honorary Surgeon Manchester Royal Infirmary

(WITH SPECIAL PLATE)

I need not apologize for discussing the problems of cancer of the stomach for the stomach is by far the commonest seat of cancer in the body It is true that in the female population the incidence of cancer of the breast is slightly greater but taking males and females together, in 1934, the last year for which official figures are available there were in England and Wales 12,269 deaths from cancer of the stomach as against 6 687 from cancer of the breast. This figure is certainly an understatement, since there were some 2,400 deaths notified as from cancer of the liver in the same year and a large proportion of those must have arisen from a latent primary growth in the stomach In the 12,269 deaths from cancer of the stomach approximately 6,600 were in men and 5 600 in women—a discrepancy between the incidence in the sexes less marked than is usually supposed One third of all cancers in men and one fifth of those in women are in the stomach

The problem of aetiology remains as baffling in cancer of the stomach as in the wider field of cancer in general One thinks of the bright hopes engendered by the discovery of Fibiger in 1913 that a form of cancer of the stomach in rats was caused by a nematode worm This worm infests the cockroach in Copenhagen and rats fed on a diet of infected cockroaches developed first a gastritis then a polyposis and finally a cancer of the stomach, capable of giving rise to distant metastases Although the worms were found in the primary gastric neoplasm they were absent from its metastases These early experiments, though they aroused a keen interest in the parasitic theory of cancer would seem to have no bearing on the aetiology of cancer of the stomach in man

Nor can it be said that the more recent work of Gye on the filterable virus of the Rous chicken sarcoma has yet solved the riddle of malignant growths in man though the solution may well be found on the lines indicated by Gye On the causation of the commoner types of cancer in man we must still admit a large degree of ignorance On certain occupational cancers of the skin and the urinary tract some light is beginning to dawn and much knowledge has been gleaned concerning the experimental tar cancer of animals but when we come to consider cancer of the stomach and intestinal tract the breast and the uterus the darkness is still profound and we can only hope that it precedes the dawn

* A lecture delivered to the Birmingham Branch of the British Medical Association March 18 1937

Predisposing Factors

While we admit our fundamental ignorance as to causation we must consider briefly what we know of the predisposing factors in cancer of the stomach Though it occurs rarely under the age of 40 it is in exceptional cases seen in the early twenties and the youngest patient I have had was a girl of 22 As in other organs it holds in the stomach that the younger the patient the more virulent is the malignancy In sex incidence the males preponderate, but only in the proportion of six to five

The factor of heredity is more difficult The work of Maud Slye (1927) has established belief in a hereditary factor in the cancer of mice and there is a growing tendency to believe that heredity may have a place in the aetiology of human cancers But it is not proved and is certainly not the most important factor

The Relation of Ulcer to Cancer

Of all the predisposing factors in the causation of cancer of the stomach the tendency of chronic gastric ulcers to undergo a malignant transformation is the one on which opinion has fluctuated most widely and controversy on this point has been most keen That we should know the truth about this relation is of obvious importance, for the conclusion to which we come must colour our whole attitude, both to the treatment of chronic gastric ulcers and to the prophylaxis of cancer of the stomach

In 1909 Wilson and MacCarty of the Mayo Clinic startled the medical world by claiming that 68 per cent of apparently simple gastric ulcers showed early malignant changes on microscopical examination and that 71 per cent of carcinomas of the stomach provided histological evidence of a previous simple ulcer This view was severely criticized by many both from the pathological and the clinical point of view Spilsbury (1921–2) pointed out that there are commonly found at the edge of a gastric ulcer gland cells which have penetrated deeply into the scar tissue and are cut off from the regenerating glands It was these cells detached from the regenerating epithelium and buried in the fibrous tissue of the ulcer, which were sometimes described as precancerous or even as the malignant transformation of an ulcer He regarded this as the error which had led the Mayo Clinic pathologists to the conclusion that 68 per cent of the peptic ulcers removed at operation showed microscopical evidence of

and comparison of Aristotle's *de Anima* with Thomas Aquinas's *Quaestiones disputatae de Anima* by someone versed in modern psychopathology and physiology would be a valuable contribution to literature

Speaking of Mr Monsarrat s book as a whole, we may properly say that "it is a serious contribution to the anatomy and physiology of thought To some readers it will recall the *Grammar of Science* Mr Monsarrat, though a very competent writer with a sense of humour not among Karl Pearson s gifts (Karl Pearson could hardly have written ' the alleged survival of the fittest was, by a somersault of logic, called in to justify the social and political actions of some who held a private complementary belief that they alone represented the fit "), is scarcely a match for the famous Grammarian in vividness of expression But he covers a wider field, and admirers of the *Grammar* are agreed that its author s subsequent attempts to enlarge its scope were not wholly successful. Parts of Mr Monsarrat's book will be hard reading for most medical men , but the truth is that clear-thinking about difficult things must be hard, and many should be grateful to Mr Monsarrat for inducing them to make an effort

THE PROBLEM OF BONE REPAIR

L Ostéosynthèse au Point de Vue Biologique Influence de la Nature du Métal (Étude Expérimentale) By G Menegaux and D Odiette (Pp 176 , 71 figures 35 fr) Paris Masson et Cie 1936

This monograph comes from the Cancer Institute of the Faculty of Medicine of Paris and is the work of Dr G Menegaux, who is surgeon to the Paris Hospitals, and Dr D Odiette, an assistant in the Cancer Institute of Paris, which is under the direction of Professor G Roussy There is an introduction by Professor Jean Verne, who upholds the value of laboratory and experimental inquiries on the part of surgeons and states that M Menegaux is one of those who believe surgery may profit from experimental work, while for the specialized technique which tissue culture requires he has had the expert laboratory assistance of M Odiette Professor Verne maintains that the reactions of the osteoblast are the key to the solution of the whole problem of bone repair, and that in his opinion the investigations of the authors of this monograph make une très belle contribution We agree with both these observations

In their introduction the authors state that this publication is the result of two years of personally conducted research work of nearly two thousand tissue cultivations and a series of animal experiments The treatise is divided into four parts, the first comprising general observations relating to the subject and particularly to the reaction following the fixation of fractures by metal splints such as plates and wires applied directly to the bone, the second and third concerned with tissue culture experiments, and the fourth a critical survey of the results of the investigations Both the arrangement of the material and the illustrations—x-ray photographs and photomicrographs—are excellent It is over a hundred years since the fixation of fractured bone fragments with metal was first carried out by Kearny-Rodgers (1825), and yet many problems relating to it remain unsolved Perhaps one of the chief is the occasional failure of union to take place in the presence of what appear to be ideal local conditions and in the absence of any general disease This is one of the questions which the authors of this monograph set themselves to solve and in connexion with this they have investigated the relative toxicity of various metals in regard to the osteoblast The results of these inquiries merit close attention on the part of all who are interested in bone growth and development

This monograph forms a valuable contribution to the subject of bone healing and is worthy of study by all surgeons who work with bone

THE FIELD OF RHEUMATIC DISEASES

Recent Advances in the Study of Rheumatism By F J Poynton M D , F R C P and Bernard Schlesinger, M D , F R C P Second edition (Pp 380 51 figures 15s) London J and A Churchill Ltd 1937

We welcome the second edition of this valuable volume in Messrs Churchill s recent advances series In the six years which have elapsed since the publication of the first edition there has been no lack of material to draw upon, but, as the authors remark, whether all this flood of papers and books represents any advance is entirely another matter After all, we are not absolutely agreed on the subject of nomenclature , there is profound disagreement with regard to the causation of rheumatism, and as to whether all forms of chronic rheumatism are attributable to the same cause or not and how far they are related to acute rheumatism on the one hand or to gout on the other As for treatment, the multifarious forms and varieties, which are recommended with an assurance which is inversely proportionate to the experience of the advocate, show how far we are from finding a panacea for this disease which takes such a toll of the community

As in the first edition, the first part of the book is concerned with acute rheumatism, and the recent theories of virus affection and allergic reactions are discussed, as well as the organization of properly equipped convalescent homes for children who have been subjected to rheumatic infection In the second part chronic arthritis is dealt with, and in the treatment section gold therapy and the administration of bee venom are reviewed, among other methods Dr Howitt contributes a chapter on physiotherapy in chronic arthritis, and Mr Eric Lloyd one on surgical methods

The practitioner will find in this volume an indication of the great activity which is going on in the investigation of the field of rheumatic diseases, but he will have to await the appearance of the next or perhaps of several further editions before he will be able to discover any definite terra firma on which he can build a clear-cut structural scheme for the diagnosis and treatment of these conditions

LOOSE-LEAF SURGERY

Nelson New Loose-Leaf Surgery Editor in-Chief, Allen O Whipple M D Associate Editor Fordyce B St. John M D Eight volumes and index volume. New York, Edinburgh, London etc Thomas Nelson and Sons 1937

When reviewing the *Nelson Loose-Leaf Living Surgery* in 1929 we said that this work in eight volumes was produced in a way which made its appearance a new departure in surgical literature The purpose of the advisory board, under the general editorial direction of Professor Allen O Whipple, was to reject from time to time every part of the work as soon as it became obsolete, and to substitute for it a new and up-to-date section to be supplied to subscribers by the publishers "In this way the book, like a living organism, should be constantly extruding worn-out parts and acquiring new ones in their place A complete set of the latest edition of this work has now been received Among the many new features which will be noted by readers familiar with *Loose-Leaf Surgery* may be mentioned the revision of Dr Hugh H Young s chapter on

are tempted to infer that such cases never occur Hurst says further 'I only know the history of two cases in which a test meal had been given before as well as after the development of carcinoma of the stomach associated with achlorhydria and in both achlorhydria was already present on the first occasion" In opposition to Hurst's contention that achlorhydria always precedes a primary cancer of the stomach Robertson (1935) has reported two cases of cancer of the stomach in which considerable free hydrochloric acid was found in the earlier test meals, while succeeding tests showed a diminution of the acidity parallel with the progress of the cancer, until finally complete achlorhydria was found I reproduce one of Robertson's charts (Fig C) Robertson quotes other similar cases from the literature

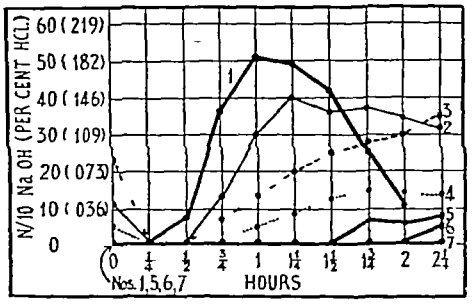

FIG C—Chart of Dr Robertson's case Curves of the secretion of free hydrochloric acid from November (No 1) to the following August (No 7)

Dr J F Wilkinson has kindly given me details of a case of proved cancer of the pyloric end of the stomach at which two test meals at an interval of four months showed a similar change from a low normal acidity to complete achlorhydria (Fig D) He has also provided

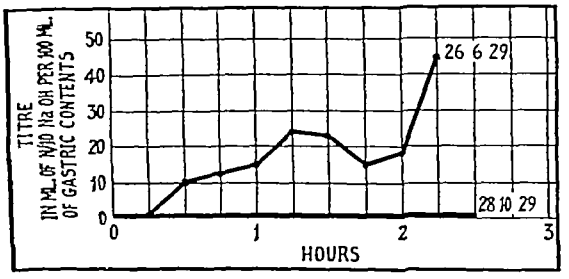

FIG D—Chart of Dr Wilkinson's case

me with test meal charts from fourteen other cases of proved cancer of the stomach, all of them, judging by the short history, primary cancers Eight of these charts showed normal acid curves and six hypochlorhydria but not achlorhydria

We know that free hydrochloric acid is present in the gastric juice of about 30 per cent of cases of cancer of the stomach Hurst regards this group of patients as suffering not from primary cancers but cancers originating in ulcer This view however involves a belief in a frequency of ulcer-cancer far greater for reasons I have already given than is warranted by the clinical and pathological data available He takes a history of over eighteen months gastric symptoms as a sufficient criterion of ulcer-cancer I hold that this is far too short, and that many primary cancers of the stomach run a much longer course than eighteen months

One difficulty in considering the validity of Hurst's theory lies in the impossibility of recognizing the atrophic gastritis without a fractional test meal. Chronic gastritis, with complete achlorhydria, states Hurst 'is often completely latent, probably the majority of cases give rise to no symptoms of any kind As patients are rarely submitted to a test meal without previous symptoms and post-mortem changes in the stomach are a great obstacle to histological studies, it is difficult in most clinics to find first-hand evidence as to the frequency of atrophic gastritis and we must fall back on the few workers who have carried out extensive researches on this matter Faber (1900), to whom in great part we owe the conception of chronic gastritis as a pathological entity made a great advance in the study of this problem when he introduced the method of injecting 10 per cent formalin into the stomach immediately after death in order to fix the mucosa for histological study and so obviate the difficulty of post mortem changes Freshly removed gastrectomy specimens have also been studied extensively, though in these there is usually (and should be always) a gross lesion such as an ulcer or cancer already well established and opinions differ widely whether the associated gastritis is a primary lesion or a secondary effect

The fractional test meal augmented by the injection of histamine that powerful stimulant of the secretion of hydrochloric acid has also been used in the study of achlorhydria By this means Faber (1927) has classified achylia as follows (1) False achylia with a scant and tardy secretion of hydrochloric acid (2) True total anacidity but with preserved pepsin secretion and chloride elimination (3) True anacidity with more or less impairment of pepsin and chloride production (Faber never found complete absence of pepsin formation) Faber states that there may be complete anacidity for a long time, though the glands of the mucosa are still intact and apparently capable of being restored to function, but he finds various stages from diffuse round-cell infiltration of the mucosa with intact glands to complete atrophy of the mucosa with destruction of the entire secretory apparatus though this last is a rare event He gives us valuable information as to the great frequency of true achylia a frequency increasing with age (Table I) Of 1 000 consecutive cases admitted to hospital there were no fewer than 306 with true achylia and you will note how the percentage increases with each decade

TABLE I—*Incidence of True Achylia (Faber)*

Age	Patients Admitted	Achylia	Percentage with Achylia
0–20	102	7	6 9
20–29	224	28	12 5
30–39	221	51	23
40–49	190	81	42 6
50–59	182	95	52
60–69	78	40	51
70 and over	5	4	80

Faber considers that achylia is not a constitutional and hereditary condition but an acquired condition due either to some remote infective cause possibly in childhood or to the irritation of food or drink and notably alcoholic drinks He contrasts this diffuse atrophic gastritis with a form of gastritis localized to the prepyloric region and associated with normal or excessive acidity which he regards as the main predisposing cause of gastric and duodenal ulcers It must be noted that Faber himself made no suggestion that he found any evidence that atrophic gastritis with achylia is a predisposing cause of cancer of the stomach

Bloomfield and Polland combined the investigations of a number of observers who used the histamine test, and

THE ACTION OF IRON

Haematologists are beginning to realize that they know less about the pathology of pernicious anaemia and idiopathic hypochromic anaemia than they thought they did five years ago Both diseases were explained as conditioned deficiencies brought about by lesions of the stomach, in the former lack of Castle's intrinsic factor and in the latter lack of hydrochloric acid If, as we now have reason to believe, Castle's factor is secreted by a different area of the stomach from that which secretes the acid, and by the upper intestine as well, what is the reason for the achlorhydria found in practically 100 per cent of patients with pernicious anaemia? Idiopathic hypochromic anaemia was considered to be due to loss of iron during menstruation and pregnancy and to failure to replace it from the diet, lack of the solvent hydrochloric acid being an important predisposing factor Iron was poorly absorbed, especially in the ferric valency, and therefore massive doses must be given to cure anaemia The iron absorbed was converted quantitatively into haemoglobin, and a rise in haemoglobin of 1 to 2 per cent a day corresponded with the absorption from the intestine of 25 to 50 mg of iron, the actual amount contained in the newly formed haemoglobin

Schulten[1] noted that 2 grammes of reduced iron a day might have no effect on a case of anaemia, while 6 grammes produced a prompt response This threshold phenomenon has been confirmed by other observers, and it is difficult to explain it on the theory that iron retention and iron utilization are synonymous, unless we postulate a threshold above which the level of iron in the alimentary tract must rise before absorption can occur J F Brock[2] dealt the final blow at the current theory of the action of massive doses of iron by showing that very much more iron was absorbed than was converted into haemoglobin One of his patients retained 1,665 mg of iron during nine days' treatment, but only 299 mg were converted into haemoglobin Brock's results were received with a surprise that bordered on incredulity, one speaker at the Association of Physicians saying that if they were true he would have expected his patients to be converted into pillars of iron, but the results have been confirmed by other workers[3] It appears that with doses of the order of 60 to 120 grains of iron and ammonium citrate or 45 to 90 grains of Blaud's pill a day, from 50 to 250 mg of iron a day are retained but only 25 to 50 mg are manufactured into haemoglobin If smaller doses are used, or if treatment is interrupted prematurely, many patients will not be cured, in spite of the absorption and deposition of large quantities of the metal[4] Though theories change, massive and prolonged iron therapy is considered as essential as ever in hypochromic anaemia, nor has any evidence been obtained that the presence of such large quantities of iron in the intestine interferes significantly with the absorption of other elements[5]

Inspired partly by Brock's results and partly by their fascinating study of the metabolism in polycythaemia vera, McCance and Widdowson[6] have propounded a new theory of the absorption and excretion of iron They were surprised to find how little iron a woman with polycythaemia lost during a considerable haemolysis induced by phenyl hydrazine,[7] and they came to the conclusions that the body has little power of excreting iron and that the metabolism of iron in normal circumstances is governed by control of absorption There is, indeed, no convincing evidence for the classical view that iron metabolism is regulated by excretion through the colon The concentration of iron in the intestine of a person on an average diet is so low that the diffusion gradient is not steep enough for much absorption to occur, unless the concentration of iron in the body fluids and tissues is subnormal, as happens in anaemia, after haemorrhage, or during rapid growth Achlorhydria decreases the retention of iron from a normal dietary intake of the metal but does not influence the retention when large amounts are given by mouth[8] Iron is transported by the plasma and its concentration is normally low The moment the concentration of iron in the plasma rises the excess is competed for by the storage organs and the excretory organs, and "the former always win" It would be a serious thing for the body if this were not so, for one-thirtieth of the erythron is destroyed every day, involving the catabolism of about 29 grammes of haemoglobin or 90 mg of iron, much of which must be carried in the plasma from the haemolytic to the haemopoietic tissues

With intakes of iron which are quite outside the physiological range, as in massive iron therapy, the

showed a penetrating ulcer on the middle of the lesser curvature (Fig. 1 Special Plate) The picture was typical of simple gastric ulcer and the usual medical treatment for that condition was advised Six weeks later she was rather better and had put on a few pounds in weight. A second radiograph taken now showed the ulcer crater nearly filled up (Plate Fig 2) After a further four months she was again losing weight and feeling rather more discomfort in spite of medical treatment. A third *x* ray taken some six months from the onset of symptoms showed a definite carcinoma at the site of the original ulcer crater (Plate Fig 3) I explored the abdomen but found early secondary deposits scattered through the peritoneum so that gastrectomy was out of the question

It is quite plain that, in spite of the deceptive *x*-ray appearance at first, this was a carcinoma from the beginning and it affords eloquent testimony to the fact that the clinical history is more important than the radiological signs I do not wish to belittle the value of an *x* ray examination It is by far the most important diagnostic weapon in our hands and it is imperative, if cancer of the stomach is to be diagnosed earlier, that every patient over 40 who complains of persistent indigestion for the *first time in his life should* be examined by *x* rays But cases do occur not uncommonly, in which the most skilled radiologist cannot be sure whether the ulcer is simple or malignant, and it is in these that the clinical history is all important

Whether the use of the flexible gastroscope will prove of great value in the differentiation between simple and malignant ulcers is doubtful Sometimes we meet with ulcer in which a careful naked-eye examination after gastrectomy does not enable us to make a positive diagnosis and we have to wait for the result of a microscopical section I conceive that the gastroscope will never be of great use in this not uncommon type however valuable it may prove in the more usual cases that present no difficulty in radiological diagnosis

Treatment

Some form of gastrectomy is of course, the only treatment that offers any hope of cure Fixation of the growth to the transverse colon or mesocolon does not necessarily rule out gastrectomy Fig 4 (Plate) shows a stomach removed by gastrectomy in which the greater part of the transverse colon had to be removed as well The patient made a good recovery and returned to work, though the growth recurred later

Where a cure is plainly impossible a palliative gastroenterostomy is only of value if there is definite obstruction at the pylorus with either vomiting or delayed emptying of the stomach shown by the radiograph If there is no such obstruction a case that is inoperable by reason of secondaries is better left alone In cancer of the cardiac end radical operation is hardly ever feasible and a palliative gastrostomy has rarely in my experience afforded much relief

I can best illustrate the question of treatment by summarizing a series of 207 cases under my care (Table III)

TABLE III —*Showing Surgical Procedure in 207 Cases of Cancer of the Stomach*

Gastrectomy	58
Palliative operations	60
Inoperable but explored	37
Inoperable	52
	207

Gastrectomy was performed in fifty eight cases with an operative mortality of fourteen or 24 1 per cent Most of them were done by the Schoemaker method, for which I have an increasing preference, since it is possible to remove at least as much of the lesser curvature by this operation as by the more usual Polya gastrectomy The high mortality is in striking contrast with that of gastrectomy for simple gastric ulcer It is due in part to the poor condition of these patients by the time they come to operation, and in part to the fact that one feels it a duty to attempt the one hopeful procedure wherever it is reasonably possible, in spite of the risk involved

Palliative operations chiefly gastro enterostomy, were done in sixty, thirty seven were explored but found to be inoperable, and in fifty-two operation was contraindicated, as radical measures were plainly impossible and there was either no obstruction to relieve or no reasonable hope of relieving it

In the palliative medical treatment I would stress the importance of treating the anaemia Many of these patients have a profound secondary anaemia, and can only be made fit for gastrectomy by a short course of iron in massive doses *This may be given as ferrous chloride or* 30- or 40 grain doses of iron and ammonium citrate A fortnight devoted to this treatment before the operation will often bring about a *remarkable improvement in the* blood picture, and transform an almost prohibitive risk into a reasonable one Even in the hopeless cases it is often possible to mitigate the distressing effects of anaemia in this way, and it should never be neglected

As to the end results of gastrectomy of forty-four *patients who recovered after* the operation one is alive and well after thirteen and a half years , one after eleven years *one after nine years* one after eight years , two after *seven years two after three years* and six under two years making a total of fourteen still surviving Twenty eight have died from recurrence usually within eighteen months and two are untraced *These results are not* materially different from those of other surgeons Partial gastrectomy will only cure a relatively small proportion of our cases, but in the present state of our knowledge it is the one hopeful method we have The results can be improved only by earlier diagnosis, and the main purpose of these remarks is to insist that all our efforts should be directed to recognizing the condition at the earliest possible stage, and acting with equal promptitude

From dissections of 100 cases B Chlyvitch and A Kozintzev (*Ann Anat path méd-chir* June 1937) conclude that the so-called intrapancreatic portion of the common bile duct lies really in a canal formed by a fold in the gland which can easily be opened without damaging the gland substance by blunt dissection along a cleavage plane of connective tissue which is indicated by a fine groove on the posterior surface of the head of the pancreas This method of approach besides avoiding damage to the pancreas also exposes the distal part of the duct of Wirsung and the vessels crossing the intrapancreatic part of the common bile duct

the last year over 6,000 out of 14,000 cases were treated in its hospitals, and the number of new artificial limbs required was 4,200, and were dealt with by the Ministry's own limb-fitting surgeons at sixteen centres While the majority of these cases were renewals, in seventy-seven cases the provision became necessary as the result of primary amputation during the year Ministry clinics, which were always predominantly for the provision of physiotherapy, continue to function, but on a very much diminished scale The whole of the Ministry's pathological work is now carried out by means of a postal service, the central laboratory being located at Roehampton This work required 25,000 examinations during the year, and it is of interest to learn that to-day, out of all the tens of thousands of tropical cases with which the laboratory has had to deal, while the entamoeba is occasionally found the presence of malarial parasites is so rare as to be virtually non-existent Among those cases which are cared for on behalf of the Ministry by local authorities there are 5,500 men in mental hospitals, each of whom is visited yearly by the Ministry's mental specialist

Of general interest will be the experience of the Ministry that with the decline in in-patient treatment there has occurred an increase in out-patient treatment This is attributed, on the one hand, to the finding that out-patient treatment is likely to be as effective as in-patient in those cases in which repeated admission to hospital has failed to effect a cure, and, on the other, to the fact that with improved conditions of employment men wish to hold their work, and for them evening clinics are provided The marked increase in the demand for surgical appliances seems undoubtedly due to the inability of pensioners to withstand the onset of general loss of tone inseparable from advancing years Lastly it may be noted that the day-to-day functions of the Ministry still require the employment of some eighty whole-time medical officers, quite apart from a considerable number working on part-time

SURGICAL RESEARCH

The Scientific Report of the Royal College of Surgeons of England for the year 1936–7 affords evidence of great and varied achievement, despite the many difficulties inevitable in a period of transition such as the College has been undergoing during the past twelve months It must be a source of gratification to the Council and staff, as it will be of interest to our readers, that the end of this period is in sight, and that it is to have its reward in the opening of the new Bernhard Baron Research Laboratories of the College in December In all the scientific departments work has necessarily been affected by the rebuilding programme The Museum rooms were involved in the structural alterations to a much greater extent than was at first anticipated, but in spite of this they were closed for only a brief space of time The staff availed themselves of this to continue the programme of rearrangement and replacement of specimens begun last year, and constant visitors to the Museum will not fail to notice the improvement In view of the fact that all workrooms on the upper floors of the College building had to be evacuated, and that the temporary basement accommodation was extremely limited, it is surprising that so much has been done to increase the usefulness of the collections and to facilitate the researches of outside workers in such varied fields as anthropology, anatomy, physiology, human and comparative osteology, and pathology

It is agreeable to note from the list of additions to the collections, recorded by the report, that the scientific public are showing in tangible form their appreciation of the benefits which the Museum affords That there was ample justification for the support which the College received from outside bodies in the provision of temporary laboratories for its research activities, to augment the facilities at the Buckston Browne Farm, is demonstrated by the excellent quality of the work described in the report and by the variety of its scope Further valuable contributions have been made to the problems of traumatic shock and intestinal strangulation, and in the latter case the results of investigations on human material have done much towards dispelling any doubts that may have been entertained as to the appropriate surgical treatment in the various types of strangulation This problem was also approached from the biochemical angle with a view to isolating the depressor substance or substances thought to be responsible for that fatal circulatory collapse which is so often the outcome of intestinal strangulation Experiments are being carried out with a view to increasing the scope of intrathoracic surgery, and important new lines of investigation have been pursued in relation to cardiac ischaemia, with highly successful results The work on the production of hypertension and of glomerulo nephritis begun last year has continued, and there is no doubt that its practical applications will be of great value Research on the massive collapse of the lung and on the production of pleural adhesions has proved itself of no less moment from a clinical point of view New ground has been covered by investigations into the physiology of the ureter, and such fundamental questions as the relation between the hypothalamus and carbohydrate metabolism, and

Cholesteatoma—This can be taken as a definite contraindication to the conservative operation It is sometimes difficult to diagnose before, but can usually be diagnosed when the aditus is enlarged during the operation In this case the modified radical method is substituted for the conservative operation arranged for previously

Polypi and Granulations—We have had several successes with the conservative mastoid operation, in spite of the presence of polypi which thus cannot be taken as a definite contraindication, they should, however, be carefully removed when operating They are usually found to arise from the posterior meatal wall, external to the tympanic membrane, and often have a process passing through the perforation and lying in the tympanic cavity This should be sought for and removed, as it keeps up the discharge and is difficult to treat by cauterization If the polypi are removed at the beginning a fair idea of the state of the middle ear can be obtained and the type of operation then be decided upon

Site of Perforation—This is the most important factor in planning the proper operation Cases with central perforations on the whole do well Those with marginal perforations do badly, whilst the conservative operation is definitely contraindicated in cases with attic perforations The majority of successful cases have been those with a low perforation which does not extend to the tympanic ring

Nature of Discharge—A scanty very smelly discharge contraindicates a conservative operation because it usually indicates a cholesteatoma A mucoid or muco purulent discharge predisposes to success but cases in which this occurs should have adequate treatment first as they can often be cleared up without operation on the mastoid

The Modified Radical Operation

This is indicated in all cases in which the conservative operation is contraindicated except where such gross damage has been done to the tympanic membrane and ossicles that there is almost nothing to preserve and the hearing is so badly damaged that no hope remains of obtaining a useful ear In these cases the radical mastoid has no disadvantages as compared with the modified radical, and a shorter post-operative period of treatment may be expected

We have performed the modified radical operation in twenty five cases In no instance has any further intervention been required The hearing is on the whole as good as could be expected after a conservative mastoid operation Two months usually elapse before the ear is dry, but it may take longer

In the modified radical mastoid operation as performed by us the antrum is opened and all infected air cells cleared The posterior meatal wall is taken down and the bridge removed The outer attic wall is next extirpated A Korner flap of the posterior meatal wall is then cut and is pulled out through the meatus to give a good view of the middle ear Polypi are removed and any overhanging shelves of bone chiselled away The ossicles and remains of the tympanic membrane are left untouched, though a grossly diseased incus may with advantage be removed The flap is put back and the cavity packed with ribbon gauze impregnated with bismuth subgallate iodoform or some other suitable antiseptic The wound is then completely sewn up The packing is left for seven days and is then changed on alternate days Packing is usually stopped fifteen days after the operation The cavity is inspected regularly and any excessive granulations are cauterized with silver nitrate A dry, epithelialized cavity may be expected in two months

The results of this operation are satisfactory in making the patient safe and with regard to the hearing and to the cure of the otorrhoea The patient must be seen fairly regularly afterwards, as wax tends to collect in the cavity, and if this is left for long it leads to reappearance of the discharge

In the light of the analysis of these cases we have been able to work out a scheme for the treatment of chronic otorrhoea as follows The patient when first seen is thoroughly examined and any focus of sepsis in the nose or nasopharynx is dealt with Conservative treatment for the ear is instituted and any polypi or granulations are cauterized weekly with silver nitrate At the end of six weeks the cases are reviewed and those not making satisfactory progress are recommended for operation Those with a central perforation, fairly good hearing and a discharge which does not smell offensive are selected for a conservative mastoid operation These patients may expect to have a healed wound, a dry ear, and an ear that will require no further attention, four weeks after operation

Cases with polypi but fairly good hearing are chosen for either a conservative or a modified radical operation At the time of operation the first step is the removal of the polypi and inspection of the middle ear If the perforation is not marginal a conservative mastoid operation is performed, but if the perforation is marginal, and particularly if the discharge is offensive even after six weeks treatment, the choice is a modified radical

Those cases with a cholesteatoma marginal perforations, an offensive discharge, or excessive granulations are treated by a modified radical operation, even if the hearing is bad, whilst the radical mastoid is reserved for cases with gross destruction of the tympanic membrane and ossicles and those with such complications as facial paralysis or extradural abscess, when complete drainage must be established

---

K Lindemann (*Z Orthop* 1937 **66** 4) discusses the nature of the process described as intra-uterine amputations which is said to be due to constriction of the limbs by amniotic bands etc He describes twenty four cases of peromelia investigated both clinically and radiologically He first discusses twenty-two cases of amputation of the forearm with stumps of varying length and shape thirteen of which showed rudimentary knob like projections in most cases there was definite hypoplasia of the elbow joint and in seven dislocation or subluxation of the head of the radius which was also hypoplastic Three cases showed radio ulnar synostosis and the majority of the longer stumps were provided with rudimentary fingers Lindemann then describes five cases of abnormalities of the lower limbs including one of a female infant with bilateral peromelia of the thighs, bilateral dislocation of the hip, and other defects A number of cases showed defects of both upper and lower limbs Thus in the majority of cases of peromelia the limb defects are not only multiple but on radiological examination show associated changes which can hardly be due to mechanical causes but seem rather to suggest a close connexion between peromelia and other hereditary somatic defects The author concludes therefore, that most cases of peromelia are due to non mechanical factors and suggests that the terms spontaneous amputation or "constriction defect" should be reserved for those cases in which the "amputated part of a limb is actually found, during or after birth.

the interesting but more recondite question of how the viruses of human and swine influenza are related Swine influenza is due to the combined action of a virus and a bacterium, the latter, *H influenzae suis*, is related closely to human *H influenzae* (Pfeiffer's bacillus) Whereas swine can be protected completely against this disease by virus vaccines, only partial protection, resulting in a modified attack, follows injection of *H influenzae suis* vaccine This however is something and since the more serious cases of influenza and especially those complicated by bronchopneumonia, have some accompanying bacterial infection it would be rash to deny altogether that bacterial vaccines can afford any protection This protection, in so far as it exists, would no doubt be better and more constant if the number of these bacteria and their serological types were not so numerous

THE BIOLOGY OF POPULATION

On November 4 Professor Raymond Pearl of Johns Hopkins University completed his Heath Clark lectures on the biology of population Professor Pearl has based the course on a thorough investigation of events within the Birth Registration Area of the United States of America Not only did he provide a minute statistical analysis of the official data, but he had obtained very precise information respecting the sexual life of a large sample (about 30 000) of American married women delivered in hospitals, and was therefore able to assess the part played by birth control in modern life more adequately than those who have depended upon the data of birth control clinics It would be impossible to give an intelligible account of Professor Pearl's detailed exposition without citing many statistical results and tabulations, and we shall now only refer to the general trend of his arguments It was made clear that the practice of birth control is in certain economic classes a major factor of declining fertility, and equally clear that according to the American data, criminal abortion reinforcing, or perhaps compensating for the inefficiency of, anti conceptual methods was a by no means negligible factor The comfortable notion that abortion is an alternative to birth control, that those who practise the latter have no use for the former, is without statistical justification But Professor Pearl was of the opinion that the modern trend of world fertility cannot be wholly, perhaps cannot be mainly, explained by the popularization of birth control Under natural conditions animals unable to fend for themselves perish Down to a time which on the scale of world or even human history, is but a moment ago that law applied in its fullest rigour to *Homo sapiens* Indeed as many recent examples prove so soon as a group is menaced, or believes itself to be menaced, by extinction or even by serious loss of the pleasures of existence, no moral principles exercise control over its actions But at the present time in the United States of America and some parts of West Europe ethical principles—for instance, the Christain duty to succour those who cannot help themselves—do find expression in State policy In the aggregate millions of human beings who under existing conditions cannot support themselves are supported by the labour of others Further in Professor Pearl's view the rate of exhaustion of the material resources of the earth—not so much food supplies as mineral resources—indicates a definite limit to the world population In his opinion the position is critical and his faith in the political wisdom of the rulers of mankind is not enthusiastic But, as he remarked, man has shown himself the most adaptable of animals in the past and may therefore get out of the mess in which he finds himself

It will be clear that the Heath Clark lectures in book form must stimulate lively discussion, and we look forward to early publication It would be premature to enter upon that discussion now, because, as we have said a good deal turns upon the interpretation of detailed statistical evidence We would only remark that Professor Pearl's lectures proved that official and unofficial machinery in the United States has made available much more information respecting the demographic position in North America than we have for our own country It is therefore satisfactory to know that in British official circles steps are being taken to extend our own sources of information It is unfortunately not true that when full knowledge is available wise decisions are always made But it is always true that without full information wise judgements are impossible

GYNAECOMASTY AND TESTICULAR FUNCTION

The development of mammary tissue in the male has always aroused considerable interest, and the older literature contains accounts of males who have even been able to suckle their own children Swelling of the breasts in newborn infants of both sexes is relatively common, and some slight degree of mammary development in pubescent boys is also not very rare Two accounts have recently been given of breast development in adult males which appeared to be closely related to testicular dysfunction and in which hormonal investigations were made The first patient, reported by Drs Bergeret, Caroli, Millot, and Simonnet,[1] was a male aged 43, who came under observation on account of glandular enlargement which proved to be secondary to carcinoma of the testicle although on first examination the testicles showed no clinically recognizable abnormality A year later when the secondary deposits had advanced in spite of radiotherapy a tumour of the right testicle was found associated with bilateral tumefaction of the breasts A biopsy of one of the breast tumours showed the appearance of an adenofibroma in which there was marked hyperplasia of the galactophoric ducts These appeared more numerous than normal in the male, and were lined by columnar cells showing evidence of active proliferation Detailed histological studies of both the primary tumour of the testicle and the secondary deposits were made post mortem Estimations of both folliculin and gonadotropic hormones which were made on several occasions in both blood and urine showed what the authors consider a marked dissociation between the two hormones The values of prolanaemia progressively increased to amounts greater than those often recorded during

[1] *Bull Mém Soc med Hôp Paris* 1931 21, 849

middle zone Another on December 15 showed some clearing in the upper and lower zones the middle zone remaining as before On December 16 the temperature started to rise again though the respiration rate never exceeded 28 per minute On December 21 there was some pain in the right renal area no gross abnormality was found on chemical microscopical or bacteriological examination of the urine The lung signs remained much the same on the right side a few rales appeared at the left base On December 22 another skiagram showed extension of the mottling in the right middle and lower zones

About this time the cough became more productive purulent sputum averaging about 180 c cm. daily and reaching a maximum of 210 c cm on December 29 Improvement now started On January 4 1937 when he had been afebrile for three days a skiagram (Fig 5) showed much clearing The cough and sputum gradually diminished By January 17 there was a trace of sputum daily but on examination numerous fine rales were heard over the whole of the right lung and at the left base, a skiagram showed no further change He was discharged to a convalescent home on January 26 *The patient was seen again on March 23 when he* felt quite well apart from slight morning cough a skiagram showed only a slight increase in the linear striations at the right lower zone

LABORATORY EXAMINATIONS

The sputum was examined for tubercle bacilli thirteen times by direct examination and once by guinea pig inoculation with negative results Culture yielded the following December 10 *Strep viridans* micrococci *H para influenzae* December 11 *Strep viridans N catarrhalis* diphtheroids, December 12, *Strep viridans* micrococci diphtheroids January 13 *Strep viridans* micrococci *H para influenzae* On December 28 mouse inoculation failed to demonstrate pneumococci A blood examination on December 9 showed a normal red-cell count and 12,000 leucocytes per c mm of which 79 per cent were polymorphs on December 18 the leucocyte count had risen to 28 400 with 96 per cent polymorphs The Wassermann reaction was negative

Case III

A man aged 67 a boot salesman was taken ill early in October 1936 with slight frontal headache malaise nasal catarrh anorexia, profuse sweating constipation and insomnia He continued his normal activities for three weeks before he took to his bed He was found to be febrile and developed a slight dry cough His previous health had been good apart from a brief febrile illness diagnosed as influenza thirty years previously which had left him with a moderate degree of deafness His fingers had been clubbed all his life and he said his father's fingers had been similarly affected there seemed to be no symptoms of chronic intrathoracic disease to account for this finding

On admission to hospital on November 11 1936 he was found to be well nourished and of rather florid complexion slightly dyspnoeic on exertion but in no distress at rest Temperature 98.9 F pulse 88 respirations 24 The upper respiratory tract showed only slight injection of the fauces with a middle-ear deafness On examination of the chest there was a lower dorsal kyphosis with generally poor expansion the breath sounds were vesicular throughout and at both bases there were very numerous rales of mixed types more on the right side No abnormality was found in other systems

For the first week in hospital the pyrexia was remittent to 99 -100 F (Chart 3) and thereafter showed only an occasional slight evening rise above normal. On November 17 the pulmonary physical signs remained unchanged a skiagram of the chest (Figs 6 and 7) showed much coarse mottling of the middle and lower zones of both lungs with a calcareous focus in the right lower zone The cough became more productive until by the beginning of December sputum amounted to 120 c cm daily Further skiagrams on November 26 and December 12 showed little change in the appearances By December 23 an improvement in the general condition was noted sputum was reduced to 15 to 30 c cm daily and the rales at the bases were less numerous A skiagram on December 31 showed a diminution of the mottling previously noted He was discharged on January 1, 1937

The patient was seen again on January 22 now free of cough and feeling well. Examination showed a few rales after cough only at the right base and a skiagram (Fig. 8) showed practically complete clearing A lipiodol examination on February 11 outlined the branches of both descending bronchi without showing any evidence of dilatation

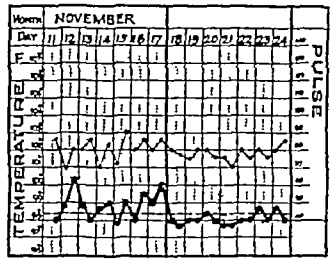

CHART 3—Showing course of the pyrexia in Case III

LABORATORY EXAMINATION

The sputum was examined three times for acid fast bacilli with negative results culture on two occasions, on December 3 and December 5, yielded *N catarrhalis Strep viridans micrococci and diphtheroids* anaerobic culture failed to demonstrate actinomyces A blood examination on November 12 showed a normal red cell count and 11,000 leucocytes per c.mm. of which 77 per cent were polymorphs On November 13 blood culture was sterile and agglutination tests for the typhoid group and *Brucella abortus* were negative The blood Wassermann reaction was also negative

In the fourth case the clinical picture was obscured by other morbid processes, the patient coming under observation first on account of rheumatoid arthritis and eventually dying of polio-encephalitis However, this provided an opportunity of correlating radiological with necropsy findings

Case IV

A man aged 29 a drain fixer was first admitted to hospital on July 11 1936 on account of an arthritis of rheumatoid type which had started in January 1935 in the hands and subsequently affected the shoulders elbows and knees At this time there were no respiratory symptoms or signs and no fever and apart from the joints the only abnormality was a chronic tonsillitis The blood Wassermann reaction was negative and the blood count normal as regards both red and white cells He was discharged on July 22 to return for tonsillectomy

He was readmitted on August 22 The arthritis was worse A few days after discharge from hospital he had developed a cough accompanied by scanty expectoration increasing dyspnoea and a feeling of tightness in the chest On examination the chest was symmetrical but showed generally poor movement persistent medium rales were heard at the right base The temperature chart for three weeks showed an occasional evening rise to 99 F and then was normal The pulmonary physical signs increased until at the beginning of September there was slight impairment of the percussion note at both bases the right more than the left and numerous crepitant rales at both bases with normal vesicular breath sounds A skiagram on August 29 showed a diffuse somewhat mottled opacity at both lower zones (Fig. 9) and another on September 5 showed no change By September 19 the physical signs had cleared and a skiagram showed both lower zones to be more translucent but with some evidence of increase in fibrous tissue On September 30 tonsillectomy was performed,

ANAESTHESIA IN GENERAL PRACTICE

This concludes the series of articles on anaesthesia contributed by invitation

ANAESTHESIA AND THE LAW

BY

D. HARCOURT KITCHIN

Of Gray's Inn Barrister at Law

The legal principles which govern the position of the anaesthetist are few and simple He is bound to use reasonable care and skill, and he must not give an anaesthetic without first having obtained the patient's consent Having said that, one has practically exhausted the law on the subject, and it only remains to consider some of the practical implications

Reasonable Care and Skill

The degree of care and skill which is reasonable varies according to the circumstances in each case and according to the mind of the judge or jury In practice, the standard required of a specialist is very high, and even a slight lapse by a man who makes anaesthesia his profession will render him liable to pay damages If, however, as happens every day, the anaesthetist is a general practitioner, it is not reasonable to expect of him the same high degree of skill, and if the court is satisfied that he has taken every reasonable care and done his best it will not find that he has been negligent At the same time, a reasonable degree of skill is always demanded, and a general practitioner who happens not to have given an anaesthetic for many years should not do so except in an emergency, if he has a mishap it will be no excuse to say that he did his best, because he should not undertake any task unless he has reason to believe that he can perform it safely An error of judgement not due to lack of care or skill is not negligence, but when a doctor has actually made a mistake and is charged with negligence he will find it difficult to satisfy a jury of uninstructed laymen, and even a judge sitting alone, that his mistake was not due to negligence The test question is always, Did the doctor do everything that could reasonably have been expected of him in the particular circumstances of the case?

Emergency may excuse a considerable amount of what might otherwise be negligence Most medical men agree that only an emergency will justify a doctor in giving an anaesthetic without first examining the patient to see that he is fit to receive the type of anaesthetic it is proposed to use Some authorities consider that, except in an emergency, a doctor should not act as surgeon and anaesthetist at the same time, but there are several exceptions to this rule in everyday practice For example, it would be unreasonable to say that a dentist doing a simple extraction, or a doctor doing a minor operation, was negligent in not calling in a colleague to give the anaesthetic In many parts of the country he would be unable to do so Many doctors have to perform long and difficult obstetrical operations alone The line will be drawn according to the evidence of what is considered reasonable by the consensus of medical opinion, and an emergency may justify a doctor in giving his own anaesthetic for an operation at which he ought not to give it in ordinary circumstances

It is unwise to anaesthetize a woman unless some reliable third person—for example, a nurse—is either present or within call, as, for instance, in an adjoining room with the door open or unlocked The patient may charge the doctor with an indecent assault, and he may find it very difficult to defend himself

Injuries associated with anaesthesia fall roughly into five classes (1) death, which may not be due to the anaesthetic at all, (2) burns, (3) mechanical injury to the mouth, and other injuries due to swallowing or inhaling foreign bodies, (4) mishaps with local anaesthetics, and (5) injuries due to unconsciousness

Anaesthetic Deaths

Death due to the anaesthetic itself is often promoted by the ill-health of the patient Many operations are undertaken as a last resort, some are unsuccessful and no one is to blame, for the patient would certainly have died in any event When, however, a patient dies from the effects of the anaesthesia alone, the two commonest causes are asphyxia from inattention to maintenance of the airway, with the action of the anaesthetic superadded, and overdose Fatal injury results on rare occasions from rupture of the stomach caused by the insertion of an endotracheal tube into the oesophagus, if the mistake is not corrected A number of deaths though not many, are due to faulty assembly of the apparatus, so that a wrong mixture is delivered at the mouth piece or unvaporized liquid is injected into the trachea Anaesthetists have been known to use apparatus in which the gas cylinders were connected to the wrong inlets, or wrongly named, so that they gave carbon dioxide or nitrous oxide gas in mistake for oxygen In spite of the ingenuity with which manufacturers attempt to make apparatus fool proof, loopholes seem to persist. At least one accident has occurred because the bottles in a Shipway apparatus were not arranged in the way the anaesthetist expected It is not safe to test Junker's apparatus only with the hand bulb, because its feeble pressure cannot be relied on to drive the liquid anaesthetic up the inlet tube if the chamber has been connected up wrongly The apparatus should be tested under working conditions, and the precautions taught in hospital carefully followed One safeguard is for the anaesthetist himself to inhale a little of the mixture at the mouth-piece

Patients have died under an anaesthetic from heart failure due to an overloaded stomach It is the anaesthetist's duty to make sure that the patient is in a fit state to be anaesthetized, but he probably has the right to assume that the patient, or the hospital staff, has obeyed his clear instructions In hospital practice, if an anaesthetist began to cross examine the ward sisters about the preparation of every patient they brought to the operating theatre there would soon be a mutiny One general principle of a doctor's liability for a nurse is that he may properly delegate certain tasks to her and assume she has done them The preparation of a patient for operation is a task which is properly given to the nurse, the anaesthetist cannot be present to supervise her, and cannot, I submit, be made liable for the consequences of her negligence It is probably his duty to make sure that routine general instructions have been issued to the ward staffs but not to ask the sister every time whether they have been carried out Nevertheless, the question whether in a particular case a particular task was rightly left to

occurred and a study of the lung changes was made (Scadding 1937) nothing comparable with these cases was observed

There was no undue incidence of previous respiratory illness in these cases two at least of them occurred in young men who had been entirely free from such troubles The aetiology thus remains obscure

Discussion

Appearances attributed to bronchopneumonia in miliary foci have been described by numerous radiologists (Wessler and Jaches, 1923 Santé, 1930) In a few instances only has confirmation of the simple pneumonic nature of these shadows been obtained by necropsy (Assmann, 1934 Oberndorfer 1928 Peschel 1930) A miliary bronchopneumonic type of influenzal pneumonia has been described (Liebmann and Schmitz 1921 Elmer and Kestermann 1931) The chief point of discussion in most of the reports in the literature has been the radiological diagnosis from pulmonary tuberculosis but in a few the clinical picture is presented in sufficient detail to enable it to be compared with that of the present series Cases recorded by Blechschmidt *et al* (1926) Münchbach (1929), and Thums (1931) have in common with the present series a similar radiological picture a gradual onset with predominantly constitutional symptoms, and a prolonged course with eventual complete resolution

In the earlier stages there may be a great similarity between the clinical picture of disseminated focal pneumonia and that of pulmonary tuberculosis of recent onset The course of the disease will settle the diagnosis in most instances without difficulty, but now that early collapse therapy is widely advocated it may be considered inadvisable to adopt a purely expectant policy where radiological evidence suggests a diagnosis of pulmonary tuberculosis Certain clinical points may be helpful in differential diagnosis The relation of the pyrexia to physical exertion which is usually so definite in cases of pulmonary tuberculosis is not seen in these cases, rest in bed does not produce that fall in the level of pyrexia which is so constant in tuberculosis A most valuable point in the diagnosis is the increasing amount of purulent sputum within a few weeks from the onset, this relatively sudden increase would not be expected in a case of tuberculosis in the absence of gross cavitation, and the continued absence of tubercle bacilli from this purulent sputum should clinch the diagnosis

The existence of the syndrome here presented calls for caution in the application of collapse therapy in cases in which pulmonary tuberculosis of acute onset is suspected on radiological grounds without confirmation from bacteriological examination

Summary

1 Four cases of pneumonia of unusual type are reported Clinically, the chief features were a relatively gradual onset with predominantly constitutional symptoms, a prolonged course, a gradual increase in the expectoration, scanty at first until about the third week, when profuse purulent sputum was being produced and an absence of signs of frank consolidation Radiologically a coarse scattered mottling affecting large areas of one or both lungs was seen

2 The aetiology is uncertain the organisms usually associated with pneumonia not being found on repeated bacteriological examinations of the sputa

3 The lesion appeared to be a pneumonia in small scattered foci, with a tendency to irregularly delayed resolution

4 Such cases form a recognizable group for which the name disseminated focal pneumonia is suggested

5 The differential diagnosis from some forms of acute pulmonary tuberculosis which may be difficult in the early stages is discussed

I am indebted to my colleagues of the department of medicine British Postgraduate Medical School for allowing me to study cases which were under their care to Dr J Duncan White for the skiagrams to Dr A B Bratton for the necropsy report on Case IV and to the Chief Medical Officer L C C for permission to publish the case reports

VARIX OF THE NECK

BY

H S BARBER, M B, B Ch

Senior Resident Surgeon Steevens's Hospital Dublin

(WITH SPECIAL PLATE)

The occurrence of a case of this rare condition which in the current textbooks on surgery is either not mentioned or is merely recorded in a somewhat doubting fashion prompted me to search the literature for further references

Among the first to describe the condition was William Hey (1814), who was consulted about a child aged 4 months suffering from a tumour in the left side of the neck just above the clavicle It was the size of a pigeon's egg bluish in appearance soft and painless on palpation The tumour seemed more tense when the child cried He thought that the swelling arose from the external jugular vein On puncture fluid blood was withdrawn The condition was eventually cured by repeated aspirations Liston (1847) and Holmes (1860) also describe varieties of sanguineous cysts of the neck These cysts are usually single, lying in the subcutaneous tissue and contain liquid venous blood They swell when the circulation is excited and are easily compressible Another case that of a boy aged 11, is reported by Richardson (1869) A pendulous tumour extending over the clavicle was present on the right side It was first noticed at the age of 2 The skin over the swelling was bluish On palpation the tumour felt uneven as if lobulated, it was painless and fluctuation was distinct There was no pulsation and it was irreducible On exploratory puncture dark fluid blood was obtained Something like a hard obliterated vein was to be felt in the deepest part of the empty cyst The

next year, and in the meantime the Laboratory recommend careful earthing of all equipment by a chain trailing on the floor or the use of electrically conducting rubber

If a patient is injured in this way it seems very doubtful whether the anaesthetist can be made liable for the effects of his otherwise harmless mixture after it has been exploded by a diathermy needle or statically charged trolley, which was no concern of his He could only be held liable if he had reason to suppose there was any peculiar danger in its use on that particular occasion

The surgeon and the hospital governors are surely entitled in the first place to rely on the manufacturers of their electrical apparatus, as independent experts, to supply them with apparatus suitable and safe for the purpose for which it is to be used None of them can be expected to be an expert electrician It may, however, be the duty of the owner of the electrical apparatus used in the theatre, whether it be the surgeon or the governing body of the hospital, to see that it is periodically inspected and maintained by an expert technician to obviate the risk of a defect in it causing an explosion It may perhaps also be the duty of the hospital governors, now that the risk is generally recognized and publicly known, to see that their theatre furniture is properly earthed to prevent it from accumulating dangerous static charges

Gags and Foreign Bodies

In a dental operation under a general anaesthetic the patient is sometimes injured by the gag, or by a swab or other body entering the trachea, and the legal question may arise whether the dentist or the anaesthetist is responsible If, for instance, a dentist does an extraction with an anaesthetist, a question which may arise is, Whose duty was it to pack the throat? In one case an assize court held that it was the duty of the dentist No finding of responsibility in a particular case will ever amount to a rule of law binding another court Each case is considered on its own merits Nevertheless, in another case where the facts are similar the court may well come to a similar conclusion

A dentist will often ask the anaesthetist to put in a gag The anaesthetist will do this, and in doing so may accidentally dislodge some of the teeth The question then arises whether he or the dentist is responsible for this injury Both may well be, and the damage for interfering with healthy incisors may be serious, especially if the patient is a young woman and they have a high cosmetic value Several anaesthetists have had to face claims of this kind A dentist will often place a swab at the back of the throat to keep blood and foreign bodies out of the trachea It is then his duty to take it away again, and if he has any difficulty in finding it he may ask the anaesthetist to help him Moral, apparently, for every anaesthetist at a dental operation Never, except in the direct emergency, step an inch outside your own province, let the dentist do his own work himself In everyday practice an anaesthetist cannot be so strict Everyone wants to help a colleague and even more, to do his best for the patient Nevertheless, this is a substantial legal risk and anaesthetists have fallen into it Injury has also been caused by the incautious use of too hot a gag

Local Anaesthetics

Local anaesthetics also have their hazards Mixtures may be made up carelessly so that the patient receives an overdose of one of the constituents Needles often break, for the points are very fine and the shafts are flexible The most usual point of fracture is at the butt, and the broken-off piece is very difficult to extract from the tissue If an incision is made on to it, it is apt to move away To guard against this known risk the doctor should not insert the needle to its full length, then, if it breaks at the butt, the broken piece will project and can be removed with forceps A new needle, which enters easily, is less likely to break than an old, blunt, or tarnished one Juries have been known to admit that a broken needle is not necessarily the result of negligence but usually the presumption is the other way The learned author of *Beven on Negligence*[1] says

> '*Prima facie* to sew up a sponge or an instrument in a patient after an operation is negligence Very great care and method is to be observed in accounting for all the appliances used, and this in proportion to the easiness with which they may escape observation, but even here the fact that some needle or portion of an instrument has been left in a wound is not conclusive but the conclusion from the fact *must be determined by a jury on a view of the whole* circumstances"

The technique of spinal anaesthesia is delicate and difficult, and one might expect to hear of a number of accidents and claims arising out of its use None of the authorities I have consulted, however, seems to have heard of one, and this rarity seems to testify to the care and skill of those who use this method, and perhaps also to its essential safety in competent hands

Accidents to Unconscious Patients

Hot water-bottles often burn unconscious patients, and sometimes the patient blames the anaesthetist This kind of claim is fairly common, especially when the anaesthetist is also the patient's general practitioner In hospital the duty of protecting the patient from this injury can properly be, and always is, delegated to a nurse, but in the home, even if a nurse is present, the general practitioner might reasonably be expected to supervise the patient's welfare before and after the operation

Even before a patient goes under the influence of the anaesthetic he loses sensitivity and mobility, and a semi conscious patient who is left with his feet near a radiator can easily be burned without noticing it or being able to attract attention Patients are also insensitive after the operation, when they have gone back to bed Many patients have been burned by bottles which have not been extremely hot, partly because their resistance had been lowered by the anaesthetic and the operation, and partly because they were unable to move out of reach No patient who is under the influence of a general anaesthetic should ever be left alone for an instant

Consent

To interfere, in however slight or innocent a way, with the person of another is technically an assault, and the assaulted party has a right to damages, which need not be in proportion to the gravity of the assault Most forms of assault, however, are not legal wrongs if the person assaulted consents freely to them It is undoubtedly an assault to deprive a person of his senses without his consent, and an anaesthetist who gives the anaesthetic without the consent of the patient takes the risk of being sued for damages The same rule applies to a surgical operation, and it is the practice in most, if not all, hospitals for the surgeon first to obtain the patient's written consent on a form drawn up for the

[1] 1928 2 1359

ance This increase in size is attributable to an influx of blood from the peripheral veins rather than to a reflux from the inferior vena cava On auscultation no murmur is to be heard

The diagnosis of a tumour which is compressible and which distends when the intrathoracic pressure is raised should present no difficulties in differentiating from the common cysts of the neck Nevertheless the rarity of the condition may cause it to be overlooked, as indeed occurred in the case reported Once the blood in the cyst coagulates and the tumour becomes solid an accurate diagnosis will be almost impossible without a clear history of previous compressibility The cysts of the neck from which it will have to be differentiated are

1 *Cavernous angioma* which also can be greatly reduced on pressure and which will gradually refill when the blood is released It does not increase in size on exertion or on holding the breath

2 *Naevo lipoma* which presents similar signs to angioma but does not possess the same degree of compressibility

3 *Branchial cysts* generally, which are not compressible On aspiration the characteristic yellowish semi-fluid matter will be obtained

4 *Aerocele and pneumatocele*, which are as rare as the condition described in this paper The former, a herniation of the tracheal mucous membrane between two rings reduces on pressure and will also increase on coughing The absence of a connexion with any of the cervical veins should assist in arriving at a diagnosis The pneumatocele is reducible accompanied by fine crepitus On auscultation a vesicular murmur will be present The treatment is in all cases by excision

Summary

1 A case of varix of the neck is reported

2 The aetiology, diagnosis and treatment are discussed

I am indebted to Mr Arthur Chance for permission to publish this case and to Dr F S Bourke for the pathological report.

Tin, alloys of tin, and tin-coated metals are widely used because of their corrosion resistance in contact with practically neutral liquids such as water milk and certain canned foods Such corrosion as does occur takes the form of localized ' black spots,' which have been studied by Brennert whose findings were published in a report (Series D, No 2) published by the International Tin Research and Development Council some time ago Further work on these spots has since been carried out by T P Hoar and issued now as Technical Publication Series A, No 63 In the present work the influences of the surface condition of the tin and the concentration of chloride ion on black spot formation have been investigated and a detailed mechanism for the process is proposed Copies may be had free of charge from the International Tin Research and Development Council, Manfield House, 378 Strand, W C.2

CARCINOMA OF THE URETER

REPORT OF A CASE

BY

ALEXANDER LYALL, M B, Ch B

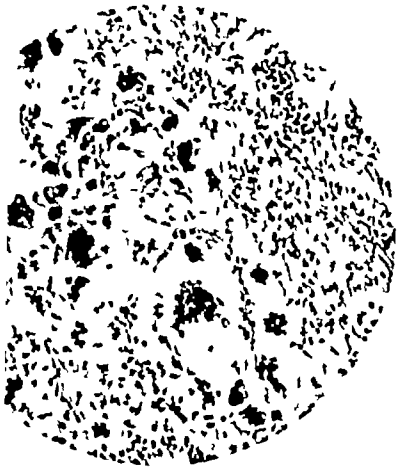
Extra Dispensary Surgeon Glasgow Royal Infirmary

(WITH SPECIAL PLATE)

Primary carcinoma of the ureter is a rare condition the first case being reported by Wising and Blix in 1876 Since that time reviews on the condition have periodically appeared, the most important being those by Spiess (1915) Judd and Struthers (1921) Meeker and McCarthy (1923) Kretschmer (1924) Glas (1926) and McCown (1930) The last named summarized a total of forty four cases from the literature including his own one and showed that the tumour occurred in the upper part of the ureter in five cases the middle in six cases and the lower end in twenty seven cases The commonest histological type of tumour is the papillary carcinoma, as found in the renal pelvis Squamous carcinoma is more rarely seen, and medullary carcinoma only occasionally (McCown 1930) Teratoid tumours are said to occur but these must be extremely rare An adenoma which is presumably derived from the Wolffian remnant has also been described (Karsner, 1931)

Because of its rarity and the very unusual appearances presented the following case of carcinoma of the ureter may be worth recording

Case Record



Mrs D aged 37 housewife was admitted to the surgical wards of the Glasgow Royal Infirmary on December 6 1935 complaining of pain and swelling on the right side of the abdomen Her illness had started seven months before admission during the last months of a pregnancy with pain in the right lumbo sacral region of a throbbing character and radiating to the right groin and down the right thigh One month after the start of the pain the affected leg began to swell and this gradually became worse for another month after which her baby was born The swelling of the leg then disappeared but reappeared after walking. During the two months preceding her admission to hospital the pain had become increasingly more severe it was constantly present without relief and shot down the right leg as far as the knee There was no history of bowel or urinary disturbance Upon admission the patient was emaciated She lay with her right leg semiflexed and complained of marked pain in the loin when an attempt was made to straighten it Abdominal palpation revealed a hard swelling the size of a Jaffa orange which was firmly fixed to the tissues of the iliac fossa The swelling was very tender to palpation The appearances suggested a subacute appendicular mass a tuberculous abscess, or sarcoma of the ilium X ray examination of the spine pelvis and hip showed no abnormality

On December 23 1935 the swelling was exposed through an extraperitoneal incision in the right iliac region It was found to consist of white tumour tissue resembling sarcoma A small piece was removed for histological examination The appearances microscopically were those of an acute carcinoma of unknown origin The patient's general condition gradually deteriorated emaciation became more and more marked and she died on January 8, 1936

Pathological Report

Post mortem examination was carried out thirteen hours after death The body was that of a very emaciated fairly young woman The thoracic organs showed nothing of note

H S BARBER VARIX OF THE NECK

1.—Giant cells of foreign body type in centre of granulation tissue

FIG 2.—Granulation tissue organization of thrombus

FIG 3.—Section of venous stalk, showing collapsed walls

R R MURRAY MOLLUSCUM FIBROSUM OR DIFFUSE FIBROMATOSIS

Posterior view of large tumour

J S MANSON ACUTE TORSION OF THE GREAT OMENTUM

Strangulated omentum showing pedicle and direction of the torsion

fluid showed no disproportionate increase in leucocytes on culture no organisms were found

For the next two days the patient appeared to improve and the pupils began to react briskly to light On March 30 he suddenly became comatose and died

Necropsy and Histological Findings

The body was well built and well nourished and no scar could be seen on the penis On examination the right lung showed a small subapical scar The right kidney was enlarged to about three times the normal size due to hydronephrotic dilatation of the pelvis and calices which contained about 120 c.cm. of urine The left kidney was normal

The heart was normal though the aorta contained insignificant streaks of atheroma

Examination of the brain showed that the veins in the dura were tense On opening extensive subarachnoid haemorrhage was seen the blood clots being thickest near the optic chiasm The median side of the left frontal lobe was extensively ploughed up by diffuse haemorrhage and felt boggy Both the internal carotids were smaller than normal The anterior communicating artery formed a broad band from the lower surface of which a minute branch was given off to the right frontal lobe At the junction of this vessel with the band was a pea sized dilatation with thin translucent walls This had burst leaving a round opening the size of a pin's head towards the left anterior region On the left middle cerebral artery a similar unruptured thin walled dilatation was also found at the beginning of a small branch

On opening the brain the interventricular septum and both the basal ganglia were seen to be extensively broken up by blood clots and some clots appeared in the ventricles The Wassermann test with post mortem serum proved negative

Sections were taken from both the ruptured and unruptured aneurysm and from areas where several brain vessels branched The aneurysm showed a part of the vessel with normal muscular coat and an intact internal elastic lamina Towards the aneurysmal sac the internal elastic lamina was absent There was no gradual thinning and no fraying out of the ends The intima was thickened and the muscular coat showed definite fibrosis The muscular coat rapidly thinned out and the wall of the sac proper was formed by inelastic connective tissue only. The distinction between the three coats was lost The endothelial lining was intact and no thrombus had formed Serial sections of the sac failed to show any relation of the origin of the aneurysm with the branch of the vessel

Section of the unruptured aneurysm revealed a distinct dilatation of the vessel at the beginning of the vascular branch but the defect in the muscular coat was some distance from the origin of the branch The muscular coat was well preserved at the origin The muscular wall opposite to the origin of this branch was also markedly dimpled The intima showed a definite compensatory hypertrophy and the internal elastic lamina was frayed out Sections of other vessels also demonstrated these irregularly distributed medial defects and patches of intimal thickenings at many places but the internal elastic lamina was intact and no dilatations were present

The cortical and striatal regions did not reveal any definite abnormalities of the smaller vessels Sections were also taken from the meninges to exclude the possibility of meningovascular syphilis but no cell infiltrations or vascular changes were seen The coronary branches did not show any atheromatous changes or any medial defects

Commentary

The thickening of the intima is the only finding which suggests an arteriosclerotic origin of the aneurysm The early age and the absence of arteriosclerosis in other vessels does not necessarily exclude the possibility A closer study of a large number of brain vessels does reveal a solitary case of arteriosclerosis of cerebral vessels in comparatively young persons but histological studies in these cases distinctly show patchy fibrosis and hyaline degeneration in media with well marked fragmentation of the elastic lamina The adventitia is generally uniformly thickened and the intima shows irregular thickening and hyaline degeneration Though the vessel becomes tortuous and a beaded appearance is produced sections do not demonstrate complete loss of musculature as in congenital or syphilitic aneurysms Thrombosis precedes a rupture by a considerable interval

The occurrence of congenital aneurysms is explained by Forbus on embryological grounds as being the result of a congenital weakness of vessel walls near the origin of branches This is not always borne out as in this case and in some others studied The medial defects are very often irregularly distributed Forbus also found that in many cases with defects in cerebral vessels similar latent defects occurred in other vessels an observation supported by Dugiud The coronaries were studied in the present case, but no medial defects were seen

These findings suggest that medial defects do not form a complete explanation of congenital aneurysms The internal elastic lamina can maintain the integrity of the cerebral vessels in the presence of such defects The embryological explanation of the occurrence of medial defects is also not always borne out The defects may occur independently some distance from the site of branching Further histological studies are therefore necessary before congenital aneurysms can be accounted for satisfactorily

RE-EXPANSION OF THE ATELECTATIC LOWER LOBE AND DISAPPEARANCE OF BRONCHIECTASIS

BY

G. H. JENNINGS, M.B., M.R.C.P.

First Assistant Department of Medicine British Postgraduate Medical School

(WITH SPECIAL PLATE)

In discussion of the factors producing bronchial dilatation it is customary to mention the weakened inflamed bronchial walls the pressure of retained secretions the expiratory strain of coughing and the possible factor of traction on the bronchial walls by intrapulmonary fibrosis

Mechanism of Production of Atelectatic Bronchiectasis

Frequently no mention is made of the constant factor of the normal elastic tension of the lung This factor, which is measurable by the intrapleural pressure is greatest in full inspiration and least in full expiration It is obviously likely to lead to pathological dilatation when the bronchial walls are inflamed and weakened In the presence of an atelectasis this force is greatly increased on the affected side as has been shown by the very high negative intrapleural pressure on that side Such pressures as −432 mm. of water have been recorded by Habliston (1928) in massive collapse of a lung On the bronchi in the collapsed lower lobes which have no expansile alveolar buffer to protect them from this external suction there is exerted a powerful and sustained dilating force Findlay (1935) has described the process of bronchial dilatation in these cases as compensatory,

Clinical Memoranda

A Case of Molluscum Fibrosum or Diffuse Fibromatosis

(WITH SPECIAL PLATE)

In August, 1936 I was requested to see what could be done for a native woman at the D R C Mission at Madzimoyo, Fort Jameson

CASE REPORT

On looking at her one's attention was immediately drawn to the large tumour which is well illustrated in the photograph reproduced on the Plate Then one saw that in addition her body was covered all over with multiple soft tumours ranging in size from that of a pin's head to the large one It was a typical picture of a condition of multiple fibromata Of the smaller tumours some were sessile and some pedunculated All were covered with smooth skin Some had atrophied apparently leaving nothing but an empty bag of skin At the distal end of the large tumour the skin had broken down probably owing to trauma or friction against clothes leaving an ulcer about 4 inches by 2 inches This was what had caused the woman to seek treatment not the mere presence of the tumour

The large tumour was growing from the right subscapular region the circumference at the base measuring 16 inches and at the widest part 30 inches therefore though apparently pedunculated it possessed a wide base On removal it weighed just over 8 lb Haemorrhage was difficult to control

The pathological report was as follows Sections of the specimen show the structure of a simple myxomatous tissue in which there are numerous foci of chronic inflammation There is no definite indication in the sections that the lesion is of nerve origin

COMMENTARY

The specimen was taken from the base of the tumour and one wonders if a sarcomatous change might not have been about to occur in degenerated myxomatous tissue According to Alexis Thompson these tumours are composed of succulent spongy fibrillated tissue rich in cells and blood vessels or of tougher more fibrous tissue with the fibres arranged in bundles In von Recklinghausen's disease the tumours comprise both fibrous and nervous tissue but in this case the condition probably belonged to the second category of Parkes Weber—"multiple molluscous tumours of the skin unaccompanied by obvious neuro fibromatosis of the nerve trunks

It would appear that this affliction is more common in the coloured races all the cases which I have seen being in Asiatics or Africans The aetiology seems to be unknown Their origin has been traced both to the corium and to the subcutaneous tissue The relatives stated that this woman was born with a black spot from which the large tumour grew, and that as far back as 1914 it was as large as a paw paw It only began to cause pain this year The tumour is being preserved

Acute Torsion of the Great Omentum*

(WITH SPECIAL PLATE)

Torsion of the omentum is one of those intra abdominal accidents which are rare in the experience of the ordinary practitioner and even a surgeon of long experience may not have met a case The following description therefore is of some interest, and seems worthy of record

CASE RECORD

A clerk aged 26 weight 14 st 6 lb well built muscular rather fat but still playing Rugby football was successfully operated on three years ago by Mr P McEvedy for a right inguinal hernia and had been free from abdominal pain until the present illness Vague abdominal pain commenced on Sunday April 18 after playing in a match on the previous Saturday and for this he took some cascara tablets and a saline purge He played again in a match on Wednesday April 21 and on the following day the pain became severe and colicky Next day Friday April 23 he was seen by me at 4 30 p m He had vomited twice but the bowels were normal as were the temperature and pulse To the right of the umbilicus there was marked tenderness and apparent thickening but no palpable mass and no abdominal distension or rigidity He was admitted at once to a nursing home for operation and it was then found that the temperature had risen to 100 and the pulse to 96 a diagnosis of acute appendicitis was made

Mr Peter McEvedy performed the operation at 7 30 p m He used the high transverse gridiron incision On opening the peritoneal cavity a small quantity of blood stained fluid escaped and a dark mass of strangulated omentum was seen above the incision By extending the incision into the rectus sheath and displacing the muscle inwards the mass was delivered and there came into view the pedicle about the thickness of a lead pencil This lay close to the transverse colon and was twisted tightly six times clockwise in the form of a right handed spiral After ligature of the pedicle and removal of the mass the appendix was explored and found to be healthy It was removed The patient made an uneventful recovery

COMMENTARY

Three varieties of torsion of the omentum are described by Lejars—(1) torsion combined with irreducible hernia (2) torsion with an empty hernial sac (3) torsion unaccompanied by hernia—and he states that 90 per cent of the cases are associated with hernia The mechanics of omental torsion have been studied and discussed in an exhaustive article by Morris (1932) Niemeier (1935), Salsbury (1935) and Robertson (1934) and little can be added to these discussions by a study of this case It is likely that torsion commenced during and after the first match and were accelerated by the exertions of the second one Probably in this case the omentum became lengthened and its terminal part hypertrophied during the time of his hernia this would then be a predisposing factor to the torsion In cases associated with a hernia the important point to realize is that the strangulation of the omentum is not caused by the hernia and that an abdominal incision is required to remove the omentum Cases such as the present one are usually diagnosed as

* Received for publication May 11 1937 Dr Manson died on October 24

RARE DISEASES OR SYNDROMES AND CLINICAL SOCIETIES

BY

F PARKES WEBER, M D, F R C.P

A "disease," as the term was formerly used, was a group of various signs and symptoms It was, in fact, what we now call a syndrome or symptom-complex When the cause or causes of such a syndrome have been more or less discovered the syndrome becomes a disease, but many syndromes of unknown causation are still called diseases, and 'disease" in such cases is only a "courtesy title' Thus, in Paget's bone disease, "disease" is a courtesy title for a syndrome, since hardly anything is known of its cause or causes In fact, it may turn out to be a syndrome common to more than one disease

Out of the many cases of fibrocystic disease of bones (using the term in the sense of a syndrome) a definite real disease has recently been separated, due to hyperparathyroidism from the presence of a functionally active endocrine tumour, a parathyroid adenoma, the surgical removal of which may lead to cure Before the discovery of the plasmodium of malaria ague was, strictly speaking, only a syndrome, which clinically at one time included various cases of cholangitis, malignant endocarditis, etc, as well as true malaria Though it is probably correct to speak of Cushing s pituitary disease, it is hardly correct to speak of Cushing's syndrome, since the actual clinical syndrome in question is not peculiar to pituitary, basophilia (basophilic adenoma), and was recognized before Cushing's important work on the subject.

Having to some extent explained my use of the terms "syndromes" and "diseases,' I come to the question of the value of clinical societies in their recognition, study, and treatment I believe that further progress in medical knowledge will largely be due to the study of "rare" diseases and syndromes For one common disease or syndrome there are several rare ones, the study of any of which can help scientific progress as much as the study of a common one Though I admit that special knowledge of common diseases is required for the alleviation of the vast majority of patients, the diagnosis even of common diseases can often not be established without a knowledge of rare ones, which have to be excluded in coming to the correct diagnosis Rare diseases are like the proverbial exceptions" in so far as they "prove" (*probant*) or test the current rules and theories that have been set up about all kinds of diseases and morbid processes

As I have above remarked, the diagnosis of common diseases and syndromes is greatly facilitated by a knowledge of the rare diseases and syndromes which have to be excluded Such a knowledge is made relatively easy by the formation of clinical societies, it is impossible for anyone to become acquainted with many rare diseases and syndromes by means only of his own private or even hospital practice From a former member I heard long ago of the advantages obtained by having been a member of the Society of Clinical Observation in London, a predecessor of the Clinical Society of London, which I myself knew before it became the present Clinical Section of the Royal Society of Medicine

One of the many advantages of demonstrating puzzling or rare cases at such a society, the transactions of which are printed, has been, so it seems to me, insufficiently acknowledged In a free country like England patients are fortunately—at all events in London—not compelled to keep to one doctor or one hospital, otherwise a patient with a rare disease or syndrome might be chained to the doctor who happened first of all to diagnose his condition until either cure was effected or the patient or the doctor died When such a pa ent decides to try a new hospital the inevitable inquiry which it makes is addressed to the medical or surgical registrar of the old hospital Much trouble is then saved if a reprint or printed "excerpt" of the account of the case from the pro ceedings of some clinical society can be sent in answer I wonder whether the medical authorities of the London County Council and analogous bodies quite realize the advantages to be gained by supporting (or even founding) such clinical societies, both in regard to the treatment of patients in their hospitals and in regard to the advance ment of medical knowledge in general State clinical societies claim a place in any Utopia of the future

INTERNATIONAL SOCIETY OF MEDICAL HYDROLOGY

The annual meeting of this society, at Wiesbaden and Frankfort opened with a presidential address from Dr VOGT (Breslau) who described the dynamic action of treatment by waters and climates He was followed by Professor LINKE who emphasized the value of cooling breezes at night, these being commonly encountered in watering places lying beneath hills In a further paper Professor PIÉRY and Dr MILHAUD (Lyons) reviewed the present knowledge of the therapeutic action of meteorological factors, and mentioned the supposedly beneficial effect of negatively charged air to sympathicotonics and that of positively charged to vagotonics Supplementary papers were read by Dr Z RAUSCH (Hungary), who advocated the use of Dalmady s tables, these being generally more useful than Hill s catathermometer or Frankenhäuser s ootherm. Papers were also read by Drs FLACH and PFLEIDERER on the same theme, the latter giving useful references to various instruments for measuring light Professor SEGA (Rimini) described the blood changes observed during a seaside cure He stated that the rate of sedimentation of the erythrocytes increased after a stay of one month by the sea, while other physical and chemical alterations were noted

Psychotherapy at Health Resorts

The psychological aspects of health resort practice were the subject for discussion on the second day Dr VERAGUTH (Zürich) showed that the time usually available for psychotherapeutic treatment in a health resort was short Nevertheless by reason of the fact that he was living in new surroundings and under the care of a new and unprejudiced physician the patient might be able to review his difficulties with more detachment and also be more frank in explaining them. The speaker considered that psychotherapeutic treatment should only be undertaken after the physician had given some special attention to the subject Dr R G GORDON (Bath) likewise emphasized these points, and showed that in many patients who had pains of a rheumatic' nature without physical signs the patient s state of mind supplied the clue He also pointed out that mental distress paved the way for true somatic changes Dr PENDL (Marienbad) spoke on the cardiac symptoms of neurotic origin Dr RÉCHAD (Turkey) referred in particular to the intestinal symptoms of emotional origin

On the third day the members of the society visited the Kerkhoff Institute in Bad Nauheim, where an address was given by Professor WEBER who demonstrated a new apparatus with which by means of a loud speaker, cardiac and extra cardial sounds may be heard which are generally inaudible Professor GOLLWITZER MEYER also described her recent work on the heart.

Mud and Peat in Balneology

On the fourth day the report of the committee on peloids was also presented. The work of this committee was begun five years ago and guiding principles have now been determined for the description of any mud, peat, or similar substances used in balneology This committee has been directed by Dr S JUDD LEWIS as chairman Contributions to the discussion which followed were made by Dr K. ZORKENDORFER (Czechoslovakia) who dealt particularly with iron sulphate moors and the water- and lipoid soluble sulphur which forms in these

Reviews

FATAL COMPLICATIONS OF ABORTION

Les Avortements Mortels By H Mondor (Pp 446, 43 figures. 65 fr) Paris Masson et Cie 1936

The mortality rate from abortion is difficult to assess, chiefly on account of the inevitable secrecy associated with it But it is undeniably considerable, ranging from 1 to 4 per cent in different series of figures This may not at first sight appear very high but taken in conjunction with the extremely large number of abortions procured annually the total death rate from this cause reaches formidable proportions Indeed, according to F J Browne it accounts for 25 per cent of the total maternal mortality The fatal complications themselves to which this book is devoted are diverse as they are numerous, and include uterine gangrene and abscess, peritonitis, septicaemia, pyaemia, internal haemorrhage, acute hepatic atrophy and ingestive poisoning The aetiology pathology clinical manifestations, and treatment are described individually and in detail, but excessive separation is avoided by the adoption of an admirably designed classification

In gratifying contrast to most other publications on the subject a rigidly clinical standpoint is adopted throughout each significant point being illustrated where possible by appropriate case histories The latter are indeed of chief interest for the author's unusually wide experience in this field has enabled him to choose peculiarly applicable examples for each condition

Perhaps the most interesting cases are those very occasional ones in which sudden death supervenes on an attempted criminal abortion The causes of this complication have never been satisfactorily elucidated, for the usual explanations of emotional shock, air embolism, coronary thrombosis, etc, though possibly accessory features, can only very rarely be held solely responsible The recent discovery by Davis however of a sympathetic nerve plexus in the cervical submucosa surrounding the external os is probably of prime importance in this connexion for it is reasonable to assume that undue stimulation in this region might conceivably set up a fatal sympathetic reflex, particularly in circumstances which conduce to a nervous hyperexcitability

The book is well annotated and beautifully illustrated, and is written with the author's characteristic fluency

PHILOSOPHY OF A SURGEON

Human Understanding and its World By K W Monsarrat. (Pp 480 42 figures 15s net) University Press of Liverpool London Hodder and Stoughton Ltd 1937

One of Galen's shorter works has for title That the best Physician is a Philosopher When one recalls the names of François Rabelais, John Locke and Oliver Wendell Holmes it seems that there is a good case for maintaining that the best philosopher is a physician whether by philosophy we mean a purely intellectual discipline or a general view of human nature Indeed the formulation of a true philosophy must require both erudition and that experience of mankind which a scientifically trained observer has acquired A clinician has the experience and granted erudition and a gift of literary expression, should be a sound philosopher Mr Monsarrat having all three qualities enters the field of philosophy under favourable auspices The plan of his book is roughly, this After a sketch of primitive habits of thought and ancient philosophies, he examines in rather more detail the standpoints of post renaissance writers This is followed by a very careful account of the evolution of modern chemical and physical theory, in which the obsolescence of matter or even structure and the emergence of energy as a working hypothesis are explained and illustrated Then we have an equally careful and fuller study of physiological and biological ideas, such work as that of Head Sherrington and Pavlov is skilfully expounded and its relevance to the author's general scheme made plain

Mr Monsarrat's thesis is that the conception of power or energy is the foundation of a true philosophy 'The living organism is constituted, not of organs structures cells chromosomes and other particles but of units of power of which all these are formal displays The shape the structural particulars, the functions the growth the senility of the organism are so many results of the action of one power-unit upon another Writing of speech defects in cerebral disease he remarks Their study provides a particularly striking lesson of the relation of dynamics to form, and of how persistent form and habit are two aspects of the same event The last sentence is the clue to a retort to the common sense objection The man in the street might say that Mr Monsarrat, as a surgeon, is much concerned with the reality of organs and structure and might ask with the centurion (if he remembers his Latin) Cur quis non prandeat hoc est? The answer is that philosophy is an obstinate attempt to think clearly and consistently Mr Monsarrat believes that his formulation of principles aids clear thinking in that it abolishes the antinomy of physiology and psychology The problem of relation is not physiological or psychological, but a problem of the origin of account and that origin is dual It is solved when the physiologist speaks for himself and the man speaking for himself turns physiologist"

It should be obvious that an adequate account of a book of 471 pages on subjects which have occupied the greatest minds through some thousands of years cannot be condensed into a few paragraphs It should be equally obvious that unless the reviewer (unlike the present writer) is a Scaliger or a Mark Pattison, criticism will be directed mainly to those items with which the critic is best acquainted, or to speak more modestly regarding which he is least ignorant Subject to that condition it appears that Mr Monsarrat does less than justice to the thought of Aristotle and, as a necessary consequence, to such writers as Thomas Aquinas It is a trifle too contemptuous of Aristotle's profoundly interesting psychology to say that his form is nothing but a mystery derived by fantasy and definition, and by logical process from definition To many minds Aristotle's conception of the soul as the form of the body' has been profoundly stimulating and indeed a skilful dialectician might argue that Mr Monsarrat's own conceptions are not very different from those of Aristotle Thomas Aquinas was justified in *thinking* of the grin without the Cheshire Cat, but not justified in asserting that the existence of a grin without a cat was a necessary conclusion from Aristotle's teaching Indeed Aristotle explicitly agreed with those who hold that the soul is not independent of some sort of body and yet not to be identified with a body of any sort whatever But we must not pursue this theme, our object was merely to make the point that the Aristotelean doctrine of form and its development (or perversion) by the Schoolmen were not so trivial as Mr Monsarrat's readers might infer Indeed, a careful study

THE PROGRESS OF EDUCATION

THE BOARD'S REPORT FOR 1936

The Board of Education, in submitting its report for 1936,[1] looks back to a year of considerable educational development. Its most important event, they say, was the passage of the Education Act, 1936 This raises the age of compulsory school attendance from 14 to 15, with exemption for children in beneficial employment and for those required to give assistance in the home in circumstances of especial hardship These provisions come into force on September 1, 1939 Local education authorities can now make grants during a limited period to managers of voluntary schools to assist the enlargement or improvement of existing schools and, under certain conditions, the building of new voluntary schools for senior children The authority may, subject to certain qualifications, appoint, dismiss, and control teachers in voluntary schools to which they are making these grants

Towards the end of 1935 the Board invited local education authorities to co-operate with it in formulating proposals to complete the reorganization of the elementary school system on the lines of the Hadow Report They are now able to say that they have enjoyed the co operation of all parties concerned, and that satisfactory progress is being made with the necessary building To assist authorities to meet the extra expense of preparing schools for the new age group added by the Education Act, 1936, and in making grants to voluntary schools, the grants of capital expenditure have been increased from 20 per cent to 50 per cent The school medical service has continued to make steady progress, but advance in the provision of nursery schools has been slow, in spite of the Board s encouragement to local education authorities There has, on the other hand, been a steady advance in the provision of special facilities in the infant departments of public elementary schools A large number of authorities have set up local children's safety committees, which make periodic surveys of their areas in order to minimize the risk of accidents to school children

Physical Education

The year was especially important in physical education The Board lays great stress on its Circular 1445, which contains a full statement of its views and advice to authorities on preparing plans of development Its chief points were the need for better facilities for physical training and games, more time for physical education, more trained teachers, and better organization Gymnasia, shower-baths, changing-rooms, playgrounds, and also playing-fields are necessary but lose much of their value, the Board pointed out, if these requirements are not fulfilled Authorities have already shown much increased interest in and attention to the development of facilities for physical education The Board have received and approved plans for fifty-nine new gymnasia in senior schools, and the plans of all new senior schools except the smaller ones include gymnasia Authorities have also acquired more land for playing-fields than in either of the two preceding financial years More children are being sent to camp schools and holiday camps, and over £50,000 was spent during the year on this activity, in addition to contributions from parents and others Various voluntary bodies, notably the National Council of Social Service, also provide camp accommodation for large numbers of elementary school children from the special areas Special and technical schools have also much improved in the provision of gymnasia baths, and playing-fields

The Board reminds authorities that physical education is an indispensable limb of general education without which education will be maimed and stunted They note that the elementary schools are making a regular practice of a daily period of organized physical activity The time allowed, the Board says, should not be much short of a full period if the children have to change into special kit for their exercises and bathe afterwards In the secondary schools the problem is more difficult The circular recommends three ordinary school periods a week in addition to the time allowed for games and swimming, but this will not be possible until more schools have gymnasia and fully trained teachers Instead of increasing the allowance of physical training for older children, schools tend to reduce it, and the circular asks those responsible to prevent physical training from being crowded out of the curriculum It is, the Board points out, of particular importance in secondary schools, because they are the source of the teachers

The number of evening classes in physical exercises, dancing, swimming, and so forth has increased from 5,830 to 7,023 Advanced courses of physical training for future teachers have been instituted in several training colleges, and more will probably be provided The students are required to devote more time to the subject, and modifications have been made in their final examinations The universities and university colleges have on the whole given less attention to the physical training of intending teachers than have the two year training colleges The secondary schools look to the universities for their teaching staffs, and it is desirable that members of the staff responsible for physical training should also be able to teach other subjects The universities are therefore considering the development of their opportunities for physical training, realizing that this will benefit all students as well as those who intend to be teachers More organizers have been appointed, and authorities have joined together in sharing organizers An important function of the organizers is to maintain close and friendly relations between the statutory authorities and the voluntary organizations

The Board s chief medical officer described the report of the Physical Education Committee of the B M.A as

'A comprehensive and valuable survey of the whole field of physical education It corroborates and elaborates the views expressed by the Board in their circular and powerfully reinforces them Its recommendations are of close concern to the Board, to local authorities, to the universities and training colleges, to voluntary organizations, teachers and parents and to the medical profession The report will help, no doubt for some years to come to shape the course and to guide the activities of all those who are interested in physical education"

In future the Board will regard clothes and shoes for physical training, provided that they remain the property of the authority and are kept at school, as a necessary part of the equipment which the authority may legally provide as part of its general duty to maintain the school.

School Health Services

The year also showed progress in health services Eighteen authorities have appointed more medical officers, whole-time and part-time, and others have appointed aural and ophthalmological specialists One has appointed a specialist for rheumatism Fifty-seven authorities have appointed more dentists, but the dental service is not as yet, says the Board, wholly satisfactory, although nearly 100,000 more children were examined than in the previous year Since the issue of Circular 1444, in which the Board pointed out deficiencies in the arrangements made by authorities for the care of crippled children, eight new orthopaedic schemes have been approved Over sixty authorities, however, still have no arrangements for this service The Board has received seventy-two and approved sixty-five new proposals for school clinics A few proposals have been received for open air schools and special schools for partially sighted and deaf children, mentally defective children and rheumatic children The number of students taking full time courses of vocational training was 1,642, of whom 1,190 were blind

The figures for the nutrition of elementary school children are almost exactly the same as those for 1935 At

[1] Education in 1936 London H M Stationery Office 1937 Pp 199 (3s 6d net)

surgery of the prostate the article on the surgery of the pancreas by the editor-in-chief which appears in Volume V, the account of regional ileitis in the same volume by Mr Abraham Penner and Dr Burrill B Crohn, and the account of injection treatment of hernia by Dr Arthur F Bratrud, and in Volume VII the article on forceps operations by Drs W E Caldwell H C Moloy, and D Anthony d'Escopo The new method of assembly is a decided improvement upon former binding covers, because a page can be taken out or inserted in any given place The loose-leaf device opens in the back of Volume VIII and the index volume, all other volumes open in the front There are no screws or springs and no key is required This should simplify the insertion of new pages, which are issued to subscribers every six months The price of the complete work, including three years delivery of renewal pages without further charge, is £32 which may be paid on an instalment basis or in cash with order less 10 per cent This charge also covers access to Nelson's research and consulting bureau for special information

Notes on Books

Nelson New Loose Leaf Medicine in eight volumes, with an additional index volume is kept up to date under the direction of an advisory board, with Professor W W Herrick of Columbia University as editor-in-chief The publishers are Thomas Nelson and Sons of New York Toronto London, Edinburgh, Paris, and Melbourne and a footnote at the back of the title page records seventeen fresh grants of copyright since the work first appeared in 1920 The purpose of the volumes with their handy device for insertion and removal of pages from time to time is to mirror present-day medicine, and it may fairly be said that this has been achieved through successive revisions and additions The latest complete set, bearing date 1937, includes a section on diseases of the blood edited by Dr George R Minot, with a chapter on leukaemia by Dr Claude E Forkner the section on diseases of the gastro-intestinal tract is in course of revision The volume devoted to diseases of the nervous system has been completely revised under the editorship of Dr Angus MacDonald Frantz the section on diseases of the cardiovascular system, edited by Dr Paul D White, contains some new matter, including an article by Dr Graybiel on clinical electrocardiography The price of the complete work including three years free delivery of renewal pages also information from Nelson's research and consulting bureau for special information for three years is £29 which may be paid on an instalment basis or in cash with order less 10 per cent

Anleitung zur Schmerzbetäubung by Professor FRITZ F HARTEL (Dresden and Leipzig J Steinkopff RM 10 in covers 11 50), is Volume 21 of the useful series of monographs on medical practice whose purpose is to provide the working doctor with information about important recent advances in medical science It is a book of just over 100 pages The first third of the text contains a discussion of general principles and an explanation of the relative merits of local and general anaesthesia for various forms of operative procedures while the remainder is divided equally between methods of local anaesthesia (including spinal anaesthesia) and methods of general anaesthesia A striking feature of this work is the large proportion of space given to local and spinal anaesthesia Among the general anaesthetics chief attention is devoted to ether gas and avertin Chloroform is mentioned briefly and the author remarks that although chloroform has been completely abandoned by many anaesthetists, yet it is still of use in certain exceptional cases Moreover, he draws attention to the fact that a satisfactory chloroform anaesthesia approaches the condition of physiological sleep more nearly than any other form of anaesthesia A brief account is given of the intravenous administration of evipan eunarcon, and pernocton The book provides a short description and estimate of the value of most of the new methods of anaesthesia, based on the practical experience of the surgical clinic of the Oskar Ziethen Krankenhaus (Berlin Lichtenberg)

Dr J BALFOUR KIRK Director of the Medical and Health Department, Mauritius has written *A Manual of Practical Tropical Sanitation* (Baillière, Tindall and Cox 7s 6d) in order to provide a book of reference for the use of sanitary inspectors It should also be helpful to managers of estates and others in charge of labour in the tropics especially in districts where expert advice is not readily available The earlier chapters deal with elementary anatomy and physiology and the more important communicable diseases The remainder of the book is devoted to sanitation The chief aspects of the subject are so ably covered that the book may be warmly recommended to medical men in outpost stations in the Colonial Service the mission field, and commercial undertakings who are responsible for sanitary measures in their districts and who, in many cases have not had the advantage of extensive instruction in this field of medicine This book is practical and concise The index is remarkably efficient, and the illustrations are simple and to the point

Dr EDOUARD PICHON has written an interesting book, *Le Développement Psychique de l'Enfant et de l'Adolescent* (Paris Masson et Cie 45 fr) not the least value of which is the fact that he follows the development of the mind well into young adult life remarking that the physician encounters in barracks among men of military age the same maladies as in school with its younger inhabitants Much of the material upon which the book is based has been obtained in the author's experience at a special clinic for the psychiatric problems of childhood in Professor Lereboullet's paediatric department, and a close association with general clinical medicine is obvious in the same outlook presented For a study of what is the basis of the child guidance movement in France this volume can be cordially recommended It contains a good index a rarity in French medical textbooks

The two stately volumes entitled *The Probable Mechanism of Cancer Formation* by Dr AMERICO GARIBALDI professor at the Lima faculty of medicine (Lima Facultad de Ciencias Medicas, 1936) are divided into six parts devoted respectively to the classification of the various pathogenic theories of cancer the metabolism of the cancer cells the cancer cell in its morphological and physiological aspects, the cancer soil an outline of a general theory on cancerization and the medical treatment of cancer in the light of the author's theory An extensive bibliography is attached to each part

Preparations and Appliances

A BAKELITE AURISCOPE

Messrs Gowllands Ltd of Morland Road Croydon Surrey have produced a new auriscope which they term the Friston auriscope This appliance has black moulded bakelite specula which will withstand all normal methods of sterilization They do not feel cold to the patient's touch are practically unbreakable and being completely black both inside and out can reflect no bright light into the eye of the aurist Quite apart from these obvious advantages and the fact that there is no silver plating to wear or to peel off the economy effected in manufacture enables the complete auriscope to be sold at a relatively low price It may be obtained from all surgical supply houses.

NUFFIELD BENEFACTION FOR THE ADVANCEMENT OF MEDICINE

FIRST REPORT OF TRUSTEES

The announcement of the gift by Lord Nuffield to the University of Oxford of one and a quarter million pounds for the promotion of research in the medical sciences was made a little more than a year ago Under the deed of covenant and trust dated November last certain trustees were appointed, including the Vice-Chancellor and the Regius Professor of Medicine, whose duty it is annually to report to the University Their first report, a record of eight months preparatory work, was presented to Convocation on November 2 Appended to it was the more detailed report made to the trustees by the Nuffield Committee, a body on which the associated hospitals (of which the Radcliffe Infirmary is the chief) and the scientific departments of the University are represented During the period under review there have been seven meetings of the trustees, ten of the committee, innumerable meetings of subcommittees, and continuous informal discussion and consultation

Of the many problems in course of solution the most difficult has been the relation of the Nuffield School to the associated hospitals on the one hand and the scientific departments of the University on the other The school, according to the intention expressed in Lord Nuffield s original letter to the Vice-Chancellor, is based on the three traditional branches of clinical work—medicine, surgery, and obstetrics and gynaecology—to which a department for anaesthetics and another for orthopaedic surgery have been added These various sections are being developed in such a way as to endow clinical research in the associated hospitals with facilities at least equal to those already provided for research in the various scientific departments of the University When the development is more complete there will be every inducement and opportunity for that fruitful co operation between the departments which was envisaged by Sir Farquhar Buzzard in his Presidential Address at the Oxford Meeting of the British Medical Association As the trustees point out, it is hardly to be expected that every part of the new school will be fully equipped to make its maximum contribution from the start Delay is distasteful to the keen worker, and the temptation to anticipate the natural course of events must be strong, but the trustees applaud the restraint of the Nuffield Committee in creating only those new posts which are essential before any serious work can begin at all, and they also congratulate the University on having in anticipation of possible developments, strengthened its preclinical departments, to which, with a view to facilitating the co-operation of those departments with the clinical professors, the trustees have authorized certain grants

Position of the Hospitals

The position of the hospitals is different from that of the preclinical departments A first-class hospital providing for the needs of its district is not in all respects a ready-made home of clinical research What is needed for research at the outset is not something better than for clinical treatment but often something different and more expensive Under the trust deed expenditure is allowed on provision for research by hospitals A progressive policy has characterized these hospitals, largely as a result of previous generosity by Lord Nuffield himself and the trustees have no doubt that this process will continue, and that the hospitals will live up to any raising of standards which may be called for as a result of their association with the school

Here again, however, it is felt that the developments and adjustments should be allowed to occur naturally instead of being artificially accelerated So far as acceleration must occur before serious work in the new departments can begin, the cost of it—that is to say, the difference between making provision at once and waiting until the time when such provision would naturally have to be made—is a proper charge on the scheme The example of neuro surgery is quoted This is a comparatively new branch of surgery, though in a not remote period all considerable hospitals may be expected to have a neuro-surgeon But it happens that the Nuffield Professor of Surgery, Mr Hugh Cairns, is a specialist in this branch, and therefore it is considered opportune and fitting to accelerate the provision of a neuro surgical unit, which would in ten years' time in any case have been necessary

The trustees had feared that the large capital expenditure which is proving inevitable would necessitate the postponement of some desirable developments and the abandonment of others But the further sum of £200,000 which Lord Nuffield has lately given for expenditure on buildings required in connexion with the scheme has relieved any apprehension on this score It is proposed that this sum shall be applied to the cost of two new wards at the Radcliffe Infirmary for the use, in the first instance, of the Nuffield Professors of Surgery and of Obstetrics and Gynaecology, with operating and x ray theatres, and of a new wing in the maternity home at the Infirmary, as well as of any further buildings in connexion with the scheme

The Nuffield Professors

The report of the Nuffield Committee mentions that powers have been obtained from the University to pay a special annual allowance of £500 to any of the Nuffield professors who undertake not to retain fees accruing to him by reason of attendance on patients in the associated hospitals, and the Professors of Obstetrics and Gynaecology and of Anaesthetics have been granted this allowance

Professor Hugh Cairns was appointed to the Nuffield chair of surgery from January last, but in the absence of facilities for his type of surgery, forwent his stipend until September , in the meantime he took an active part in the work of committees and in planning his department Professor R R Macintosh was appointed to the chair of anaesthetics as from February, but was granted leave of absence for the remainder of the academic year, and spent the time in preparation, including a visit to America to investigate anaesthetic practice there Professor Chassar Moir was appointed in April to the chair of obstetrics and gynaecology, his appointment to date from October, 1937, and he too has been engaged in constructing his department, which will be in working order several months earlier than would otherwise have been the case The honorary clinical director of the Wingfield Morris, one of the associated hospitals, Professor G R Girdlestone, has been appointed to the Nuffield chair of orthopaedic surgery, but without stipend or restriction as to private practice, and it is hoped to provide him with an assistant who may ultimately be a Nuffield Reader

It is announced this week that Professor L J Witts has been appointed Nuffield Professor of Clinical Medicine Until this important post was filled many questions as to laboratory services affecting other departments had to remain undecided The authorized appointment of a

diffusion gradient in the intestine rises and positive balances must be expected It seems as if the marrow is sluggish in hypochromic anaemia and can only be goaded into activity by the presence of high concentrations of iron, and owing to the activity of the storage organs these can only be maintained by the continuous ingestion of huge doses The threshold phenomenon is therefore due to a threshold of marrow stimulation and not of intestinal absorption There is no explanation why the marrow becomes sluggish nor why iron sequestered during therapeutic administration seems no longer available to the organism, while the iron stored spontaneously by the newborn infant or by the patient with pernicious anaemia is readily used for erythropoiesis A wealth of problems remains to be solved, but the analysis of iron metabolism is so arduous that progress must be expected to be slow The action of iron differs significantly in animals and in man, and progress in therapeutics depends ultimately on close collaboration between the wards and the laboratories Members of the British Medical Association will take pleasure in the knowledge that part of J F Brock's experiments were carried out during tenure of a Walter Dixon Scholarship

MEDICAL WORK OF THE MINISTRY OF PENSIONS

Throughout the decade following the war the medical work of the Ministry of Pensions, though necessarily decreasing continued on an immense scale Medical boards were called upon to make some five million examinations The Ministry's own hospital accommodation alone averaged 8 000 beds, while pensioners altogether received 80 000 courses of in patient treatment and were fitted with 11 000 artificial limbs annually Last year the number of medical boards had declined to 5 200, and the number of beds in Ministry hospitals to 1 800—still requiring a nursing service of 200 and some 800 other subordinate hospital staff

The numerical diminution from earlier years is so considerable that it might be assumed the medical work of the Ministry is now circumscribed within a narrow routine This is far from being the case, since the decrease in the quantity of work has to a large extent been balanced by its complexity as the war becomes more distant In the years closely following the war it was relatively easy to decide on the relation of current pathological conditions to the effects of war service Now after nearly twenty years the ex-service man is passing into later middle age and has suffered a long-continued period of civilian economic stress The connexion of his present clinical condition with war service raises many difficult problems Does it of necessity follow that because a man who is now becoming a chronic rheumatic or bronchitic suffered from a slight attack of rheumatism or bronchitis during the war and even received a pension for it his present condition is directly related to war service, and how far is the need for treatment to-day the outcome of war service to the exclusion of the effects of civilian life and advancing age? What is the possible connexion with war service in the case of a man in whom keratitis or tuberculosis is now found to be developing? Or again, on the death of a pensioner, to what extent has his war service determined the cause and the time of his death?

These are the kind of intricate medical problems to which the Ministry must find an answer compatible with the most recent medical knowledge and fair alike to the pensioner his dependants, and the State The need for such allocation of pathological causation to different, often indeterminate and largely interlocked factors is for the most part foreign to normal medical practice, though analogous to compensation insurance work, and the medical staff of the Ministry has been navigating a largely uncharted sea Its consultants, drawn from the teaching hospitals have naturally played a large part in the determination of these problems, but even so it not seldom becomes necessary in order to co-ordinate differing specialist opinion to refer cases to independent medical experts appointed by the Presidents of the Royal Colleges of Physicians and Surgeons and in the last year the number of such references was 141 As might be expected, the problems were mainly medical and neurological rather than surgical The relationship between thrombo-angiitis obliterans and gunshot wounds, that of latent keratitis to gassing of gastric ulcer to a previous dysentery, or tuberculosis to gunshot wounds of the chest or gassing, are among the conditions to be sifted each on its individual merits Naturally in considering the fresh claims to pension at this date attention must be given to the experience derived from a mass of clinical records, the evidence from which often throws considerable doubt on many of those statements which are handed on from one textbook to another as to causation and connexion with disease or trauma, of which there had been little experience

Apart from its pension problems (increasingly widows' cases) and those of medical administration, a large part of the Ministry's work is to treat disabilities peculiar to war service and a visit to any one of its hospitals will show that its continuous aim is to keep abreast of the times indeed it would be lacking in its duty if it did not do so, since during

injection, mostly of iodine preparations, and in quite a number of cases the tonsil had shrunk considerably He believed radium in the early cases to be the ideal treatment when combined with the usual constitutional measures Mr M F NICHOLLS said that tuberculous glands of the neck appeared now to be extremely uncommon in a children s hospital compared with a former period Those he had seen were in young adults rather than in children, and usually the infection was a relatively mild one—a point to be borne in mind when assessing the value of any form of treatment Mr A SIMPSON-SMITH spoke to the same effect The condition as seen in the present day must be very different from that observed by the older surgeons The great disadvantage of medical treatment, even radium treatment, was the length of time entailed His practice had been to send the children away for open-air treatment for three months, and if the glands had not then subsided to operate The results had been good, excepting only in cases in which there had been marked periadenitis Mr CHARLES DONALD mentioned that in diagnosing the condition from branchial cysts his experience was that, unlike tuberculous glands, branchial cysts were not tense at all, it was as if the capsule were too big for the fluid within

Professor GREY TURNER from the chair, said that in former days it was customary to operate in practically all cases, and he had never seen better dissections than those carried out by some Newcastle surgeons, especially Rutherford Morison, but unfortunately the results were very uncertain Some patients were permanently cured, in others the results were not satisfactory In one group of cases infection was quite obviously from the naso-pharynx, and in another the glands were merely the outcrop from a focus in the mediastinum or mesentery In the first group he was quite satisfied that the patients could be cured by an adequate surgical operation, no niggardly intervention would serve In the other group it might be necessary to intervene because the glands were breaking down, but treatment along general lines was more rational

AURAL VERTIGO

At a meeting of the Section of Otology of the Royal Society of Medicine on November 5 Mr A J WRIGHT brought forward a clinical study of aural vertigo It was based on seventy-three cases in all of which vertigo had been the principal symptom complained of, which had been referred to an aurist, and from which middle-ear suppuration was absent

Many of these cases had a history of auditory deafness dating back to early adult life In the group in which the auditory symptoms had preceded the vertiginal, the interval before the onset of vertigo, except in two cases, was a period of months or years, in one case extending even to thirty years So far as the affected side was concerned, there was some loss of hearing in all cases except two, and even in these two there was temporary deafness during the attack In half the total number the hearing on the unaffected side was normal, in the other half there was a bilateral defect, so extreme in eight cases that no useful hearing remained With regard to tone loss, the upper portion of the scale was lost in eighteen cases, the lower portion in nine, and in twelve the defect was for all tones The degree of loss of hearing was not a reliable guide in estimating prognosis

With few exceptions the vertigo was severe in degree The complaint by its nature was mentally disturbing and produced such a feeling of insecurity that, as was only to be expected, some subjective giddiness persisted for a time as a functional manifestation after the organic changes had ceased to make progress either spontaneously or as a result of treatment In addition to tinnitus a sensation of numbness was experienced One or more foci of infection were noted in all cases, such as infected teeth, tonsils, antra, gall-bladder, or uterus , Dental, tonsillar, and antral infections were in great preponderance

The grade and duration of this complaint were variable Over long periods there might be complete freedom from giddiness While the complaint was progressive, the progress might be spontaneously and permanently arrested at any stage As a result of this review of these seventy three cases Mr Wright believed that the picture of a definite disease could be recognized The picture as seen by him was a chronic progressive lesion of the labyrinth, running a very irregular but long course, and always producing some permanent damage as evidenced by loss of hearing The disease did not result from a lesion in the middle ear, but was primarily a condition in the labyrinth, and increased irritability of the labyrinth marked its course A parallel clinical picture was to be seen in chronic iritis As for treatment, the only procedure was to get rid of the focus of infection, by draining the antrum or taking out the teeth, as the case might be The condition was a chronic inflammatory lesion of the labyrinth secondary to an infective focus

Sea sickness

Dr T GWYNNE MAITLAND medical superintendent of the Cunard White Star Line, in opening a discussion on sea-sickness, said that the symptoms associated with this term could be produced in many other ways than by exposure to the rolling and pitching of a ship Other experiences causing vertigo, nausea, vomiting, and prostration in a greater or lesser degree, though apparently different, were not fundamentally so These included travel by air, exposure to the swift rise and fall of a lift or to the rotation of a Bárany chair, as well as travel by motor car or by train, and all these experiences resolved themselves into a failure of equilibrium The peripheral reactions, such as gastric atony and diaphragmatic tug were a direct consequence of some dysfunction of the central organs of equilibration In all experiences entailing acceleration of gravity—the "g" of physics—as in a sharp rise and fall, the abdominal walls played a part in emptying the stomach in that they reflexly contracted to avoid visceral displacement, but there were still a variety of experiences in which "g" was not a factor, and yet vomiting was unfailingly excited Acidosis in the initial stage of vomiting was no longer considered a factor The only direction in which there had been any substantial progress in research was with regard to the importance of the centres controlling equilibrium, and it was agreed that the middle ear was the chief offender in causing disequilibration

Mr H V FORSTER said that sea-sickness was the reaction of susceptible individuals to a disturbing and unusual environment Competent seamen might be susceptible Some passengers declared that they did not suffer unless a corkscrew motion developed The otologist might see in this quick tilting a test of the efficient action of the semicircular canals, but such an abrupt stimulation of the vestibular nervous system, according to Kotyza, increased particularly the tonus of the parasympathetic vegetative nervous system The mechanical theories of the causation of sea-sickness were said to be discredited, nevertheless, the otologist might inquire whether labyrinth stimulation might not be an important factor in its development Deaf mutes were said not to be susceptible Giddiness was sometimes complained of, but not often The otologist might also ask whether nystagmus was observed He was informed that it was not recognized as a definite physical sign

In the course of further discussion Mr ERIC WATSON WILLIAMS said that there appeared to be two distinct mechanisms at work, one rectilinear and the other rotatory, each of which produced its chief effect at different periods of life—the rectilinear in children, the rotatory in older persons Mr DOUGLAS GUTHRIE mentioned that there came to a school for the deaf in Edinburgh a number of

the bearing of the secretory mechanisms of the gastric mucosa on ulcer production, have been tackled with skill

We cannot but rejoice that the young surgeon of the future will be afforded such an excellent opportunity, in the Bernhard Baron Research Laboratories, of combining the experience of the clinic with research on a scientific basis into the practical problems which confront him in his hospital work These laboratories spacious and equipped with the most up-to-date apparatus, will certainly attract many more research workers than it has hitherto been found possible to house, and the outlay of the Royal College of Surgeons on research must of necessity be greatly increased As was pointed out last year, only £3,000 of the £11,000, which represents the annual expenditure on scientific activities, is derived from specific endowments, and it would indeed be unfortunate if the pioneer work of this new research institute were to be handicapped by lack of the funds necessary to meet its running expenses We therefore hope to learn, in the not very distant future of endowments expressly designed to further what is undoubtedly a most promising beginning

RESEARCH ON MENTAL CONSTITUTION

When Mrs R G Burden warden of the National Institutions for Persons requiring Care and Control considered how she could best help the mental health of the country she wisely decided that the problem must be approached fundamentally She therefore gave £10 000 to trustees for the study of problems underlying the causation and inheritance of normal and abnormal minds and asked that both principal and interest should be expended over a period of not less than five years The managers of the Burden Mental Research Trust include representatives of the British Medical Association the Medical Research Council and other official and unofficial bodies of first-class standing The principal investigator Dr J A Fraser Roberts and two assistants have been carrying out work along three main lines Their objects are complete ascertainment of the mentality of a cross section of mentally normal school population an analogous study of a known and certified mentally abnormal population and an examination after death of brains of persons of both classes in order to ascertain how if at all they differ They have already tested all the children in Bath City whose dates of birth fell between September 1 1921 and August 31 1925—a total of 3 400 Among other studies they have analysed the distribution of intelligence test scores the resemblance between brothers and sisters the relation of intelligence to family size and mental function in relation to health, maternal age at birth and other factors The lowest 8 per cent of Binet intelligence quotients form a special group of 260 a most instructive group conclusions from which will help to interpret the findings in other studies of institutional defectives The known abnormal material is at Stoke Park Colony which even before the Burden Trust had been making most careful records of the physical mental and social conditions of defectives Since the Trust began its work 1 000 more consecutive case reports have been made Analysis of this material has not yet started but is awaiting the completion of the work on the normal children Portions of it are however giving valuable data for comparison Up to October this year the Trust had collected the brains of 123 defectives and 82 normal persons—a unique and valuable assembly which is available for research by anyone who applies for permission The staff are examining the size weight convolutional pattern embryological errors and pathological conditions of the defective brain as compared with the normal and are making an intensive histological study of the cortical differences between the two classes They are also preparing an atlas which will depict photographically the brains of a consecutive and unselected series of 120 mental defectives with all relevant data compared with the brains of normal individuals of the same chronological age The material will thus be available to a wider circle of trained observers The programme will require much longer than the five years mentioned in the trust deed The Bath scheme will be completed within the period originally planned but useful extensions would be possible—for example a thorough follow up of certain remarkable families The results hitherto have been so satisfactory that arrangements are being considered to continue the activities of the Trust as part of the regular work of the colony If this is done outside survey work can remain part of the activities and for this the trustees hope to secure facilities in Bristol Dr Roberts has taken a wide view of the terms of his reference and has tried to make the work of the Burden Trust complementary to and not overlapping that of the Darwin Trust This is one of the most important pieces of mental research that have been undertaken in any country and its results will be awaited with keen interest

INFLUENZA PROPHYLAXIS

There are unfortunately no considerable advances to record in the difficult sphere of specific immunization against influenza Such small scale attempts as were made last winter to produce immunity by injections of inactivated virus produced no significant results and the discovery that there are several strains of the influenza virus which to some extent at least are immunologically distinct has complicated this difficult question still further There seems to be no prospect at present of material for this treatment becoming generally available and the main practical question is still whether vaccines made from respiratory tract bacteria have any protective value Most of the evidence in their favour concerns the prevention of colds only, and a good deal of it emerges in sorry shape from statistical study while some reports deny the efficacy of this proceeding altogether A small crumb of comfort is perhaps to be found in recent work by Shope [1] which is concerned largely with

Radiological Abnormalities

A common difficulty in the medicine of to day, Sir Edmund said, was that of the diagnosis of affections of the small intestine in cases in which radiological abnormalities or peculiarities were observed Various deformities—kinks, narrowings, loops, immobility, or adhesions—were often recognized or suspected radiologically To attempt an exact diagnosis from such observations alone would be to ask too much, but with skilled observation these radiological findings were in most cases confirmed when there was occasion for operation Four cases were described in which a fixed ileum, seen radiologically, was found at operation to be free from adhesions itself but immobilized because the caecum was adherent to the ovary, or the ascending to the transverse colon, or because the appendix was inflamed Such cases explained the caution displayed by radiologists of experience in interpreting what was shown on the screen or the plate It was necessary to have as much evidence as possible about the state of adjoining organs, and particularly the appendix and other parts of the alimentary canal

R P Picton-Davies had analysed 410 cases (excluding those in which a gastro-enterostomy had been done, and others in which appendicitis was recognized clinically) which had had some radiological investigation, by O A Marxer, of the small intestine In 283 there was no symptom referable to the ileum, and there had been no operation In these cases the conditions reported were as follows ileum and caecum not normally mobile, 119, terminal ileum not normally mobile, 81, ileum and caecum not separated by manipulation, 21, ileum and appendix not separated by manipulation, 5, ileal stasis, which was only recorded if there had been several hours delay, 57 In the remaining 127 cases symptoms were complained of which might have been associated with the small intestine, but in ninety-two of them other diagnoses were made In thirty-five cases the symptoms were believed to be due to interference with the small intestine from a variety of causes These various disturbances were not, strictly speaking, diseases of the small intestine, but they were more frequent than the accepted diseases, and were therefore clinically more important Even so the incidence in this series of over 8,500 patients was only 0 4 per cent

The speaker then described a series of cases of disorder of the small intestine due to (1) ileal stasis—this was defined as a delay of up to forty hours from lack of tone, the absence of adhesions being confirmed at operation, (2) adhesions following appendicectomy, ovariotomy, and other operations, (3) tuberculous glands, (4) partial volvulus, (5) a previous peritonitis, (6) tumours in the abdomen In five cases the cause of the disturbance of the small intestine was unknown There was a general likeness between the symptoms of various disorders of the small intestine, they suggested usually a mild chronic obstruction with irritation In the thirty-five patients the symptoms noted in order of frequency were flatulence, relieved by flatus or gurgling, pain or discomfort in the right iliac fossa, which might be grumbling, aching, or colicky in type and was often felt after taking food, nausea, occasional vomiting, loss of appetite, diarrhoea, constipation, or alternating diarrhoea and constipation, and general symptoms such as headache exhaustion, and sleeplessness Nervous accompaniments were usually prominent The signs were distension tenderness, and visible peristalsis the x-ray evidence, and abnormal stools, sometimes pultaceous An enormous dilatation of the jejunum could be borne if it took place gradually

Treatment and Progress

The progress of the cases was better than might have been expected Eighteen out of the thirty-five were improved by medical treatment and exploration was not needed, five were operated upon successfully

The treatment varied for every case It included poultices, massage, faradism, exercises, and the use of a belt, rest and posture, a mixed diet, with or without fruit, salads, and greens, and having a fat content adjusted to the digestive capabilities of the individual patient, and in addition there was the usual calming of the patient's fears and general encouragement Of medicines, paraffin, sulphocarbolate of soda, β-naphthol, belladonna, kaolin, and sometimes castor oil were perhaps most useful When the small intestine was disturbed the colon had to be treated, it was remarkable what relief of discomfort followed its evacuation in some cases

Finally, Sir Edmund said that, whatever the original lesion, if the action of the jejunum or ileum was interfered with such interference would give rise to characteristic symptoms In the diagnosis of difficult cases, after other and commoner sources of disturbance had been excluded, it was well, as the examples quoted showed, to remember the small intestine

General Discussion

In the discussion which followed Mr CHARLES WELLS asked whether Sir Edmund Spriggs thought that there was anything to be gained by conserving the ileo-caecal valve whenever possible in anastomosing the large and small intestine To do so might entail more technical difficulty in the operation, but would result in less drastic alteration of the content of the small intestine It had been suggested that following entero-colostomy there was a grave risk of toxaemia, and he asked Sir Edmund's opinion on the likelihood of this occurrence Sir Edmund seemed to have advocated gastro-enterostomy for the relief of symptoms caused by duodenal diverticula In the few cases which Mr Wells himself had dealt with it had been possible to dissect out the diverticulum and close off the opening into the duodenum without undue difficulty, and this seemed to be the operation of choice provided it did not involve any unwarranted risk Finally, the subject of foreign body was always an interesting one In the duodenum pins and hair slides were not uncommonly seen, especially in children In one case a hair-slide had penetrated the wall of the duodenum and come to lie in the pelvis of the kidney, where it had caused a pyonephrosis In another case—of intestinal obstruction in an old lady—Mr Wells said that he had found a foreign body obstructing the small intestine where it was narrowed by an adhesion to an old laparotomy wound On removing the offending object he was amazed to find an intact grape which had inadvertently been swallowed whole

Mr W A THOMPSON agreed that resection was necessary in some cases of ileo-caecal tuberculosis, but thought a short-circuiting operation was a safer primary procedure In three cases he had found that the contemplated resection was not necessary as the patients had improved so considerably The site and extent of the resection were probably the most important factors in occasionally causing severe and intractable diarrhoea He had had some twelve cases in which resections involving lower ileum, caecum, and varying portions of large bowel had produced no such complaint He was opposed to attempts at retaining and utilizing the ileo-caecal valve, believing such a doubtful addition to an already serious operation added materially to the mortality Large objects had been known to pass down the small intestine, but so far as children were concerned he was convinced that open safety-pins and 'kirbigrips' or other solid articles two and a half inches or more in length should be removed while they were still in the stomach rather than wait until they reached the second portion of the duodenum, where so many of them ultimately were held up and where operation was more difficult

Dermoid and Allied Renal Cysts

At the same meeting Mr J COSBIE ROSS read a short paper on dermoid and allied cysts of the kidney

pregnancy, whilst the folliculinaemia showed a progressive decrease The second case reported by Drs Monier-Vinard Caridroit, and Brunel [2] was that of a coloured male aged 47 complaining of impotence after previously enjoying "un appetit et une activité génitale extraordinaires" The impotence had been noticed for a year, and had been preceded for some years by an irregular increase in the size of the breasts At the time of examination these resembled the breasts of a girl at puberty the nipples being surrounded by a brown areola and the glandular tissue being lobulated and clearly limited Examination of the testicles showed bilateral atrophy Biological assay of the male and female hormones in the urine revealed that both were present, but that the former was less than in the normal subject, whilst the second was greatly increased The patient was treated with subcutaneous injections of acetate of testosterone at two daily intervals 130 milligrammes were injected altogether Under this treatment there was a definite diminution in size and a softening of the breast tumours whilst the patient announced "qu'il avait retrouvé un impérieux appetit génital et que l'accomplissement de la function sexuelle s effectuait d une façon aussi satisfaisante qu'il pouvait le désirer" Unfortunately this happy result was only of temporary duration subsequent injections having progressively less effect The authors note with satisfaction however that the breast enlargement remains sensibly diminished

THE LIVER AND THE NERVOUS SYSTEM

That there is an intimate if obscure relation between disorders of the liver and of the nervous system is by now too well substantiated to be questioned The subject has lately been discussed in a series of papers from Marseilles edited by L Cornil [3] The best-known instance of combined disease of the liver and the brain is perhaps Wilson's disease or hepato lenticular degeneration In this a biliary cirrhosis is associated with progressive degeneration of the corpus striatum That the disease of the liver is primary, or at least antecedent, to that of the brain is suggested by a number of records some of them recent, where this sequence has been established by clinical observation One of the most clearly authenticated examples of this kind is quoted by H Roger L Cornil and P L Paillas a girl of 12 years underwent splenectomy for gastric haemorrhages associated with splenomegaly and was found at operation and subsequent biopsy to have hepatic cirrhosis Six months later she developed a striatal syndrome Again, as these authors point out it has been possible to produce histological lesions resembling encephalitis lethargica in dogs by the establishment of an Eck s fistula Such lesions must be interpreted as a toxic encephalitis More obscure is the correlation of alcoholic polyneuritis and cirrhosis of the liver Although in some patients these two conditions may coincide or the polyneuritis be consecutive to the cirrhosis it is difficult to agree with these French workers that the existing evidence in any way establishes hepatic insufficiency as a cause of the neuritis In another paper C Mattei and M Recordier argue that delirium and mental disorder occurring in the course of a toxaemia are symptomatic of hepatic insufficiency They adduce clinical evidence in support of this theory —namely the relief of these mental symptoms by a course of injections of hepatic extract (Carrion or Choay)—noting that the symptoms are apt to recur if the injections are discontinued at too early a stage in recovery A review of this subject, though brief, would be incomplete without reference to the nuclear jaundice in the new born which in some instances is associated with erythroblastosis foetalis The lenticular nucleus and hypothalamic regions are here particularly affected It is reported by B Brouwer [4] that a similar striatal disease may also occur in infants where jaundice has been caused by umbilical infection In addition he has described a case in which striatal changes resembling Wilson's disease developed in an otherwise characteristic example of haemochromatosis In spite of this he does not support the view that a hepatic toxin is responsible for such cerebral complications but considers that the hepato-cerebral degenerations as a whole are an expression of a metabolic disturbance which rests on a congenital or familial basis That the problem is however more complex is suggested by the fact that a definite striatal degeneration associated clinically with a disturbance resembling Parkinsonism is recognized in chronic industrial manganese poisoning Although hepatic disease is not so clearly established in such cases it has been shown by G M Findlay [5] that biliary cirrhosis can be produced in animals by repeated small doses of manganous chloride This suggests that the cerebral disturbance is closely linked with hepatic disease

---

The next session of the General Medical Council will open on Tuesday November 23 at 2 o'clock when the President, Sir Norman Walker M D will take the chair and deliver an address The Council will sit thereafter from day to day until its business is concluded

---

The President and Council of the Royal Society have awarded the Copley medal to Sir Henry Dale M D F R S in recognition of his important contribution to pharmacology and the Buchanan medal to General Frederick F Russel M D for his work in relation to public health problems in many parts of the world on behalf of the International Health Division of the Rockefeller Foundation

---

The biennial Huxley Lecture on recent advances in science in their relation to practical medicine will be delivered by Professor E D Adrian F R S at the Charing Cross Hospital Medical School, Chandos Place W C on Thursday next, November 18 at 5 p m Professor Adrian s subject is "Huxley the Brain and the Mind" The chair will be taken by Dr Gordon M Holmes F R S Admission is free by ticket obtainable from the dean of the medical school

NATIONAL PHYSICAL TRAINING

A discussion on national physical training occupied a crowded meeting of the Medical Society of London on November 8 Mr J E H ROBERTS presided

Sir JOSEPH BARCROFT opened with some remarks on the criteria of physical fitness He described a recent experiment made in the Army at Aldershot to improve the physique of recruits A squad of 33 men was taken, all of them far below the Army standard At the end of the fourth week of training the required standard had been reached by 19 of the men, and at the end of eleven weeks 24 were found up to the standard and 6 on the borderline The average age of these men was 18½ years, their height 5 ft 4½ in, and their weight on joining 109 75 lb, and after training, 117 75 lb The exercise tolerance test on joining showed 88–110–78 beats per minute, and after training 84–103–77 In this respect there had not been a great deal of change and he himself did not understand the slowing of the pulse after exercise as compared with what it was before the exercise was undertaken The average chest measurement was 33 3 in at the start, and 35 in after the course But what was the significance of that change? The men were more muscular admittedly, and they might have put on fat as well If the chest were regarded as a cylinder an increase of 1½ in in circumference meant an increase of, say, 1/4 in in radius, and it was a question how much of this was accounted for by greater thickness of wall so that there might not have been any real increase in size of cavity The increase in vital capacity was more pronounced—3,120 c cm on joining and 3,430 c cm at the end The question of nourishment was an integral part of the problem of physical training He showed the diet sheets of these Aldershot recruits, which were on the most liberal scale They had 4,700 calories a day, whereas 3,500 was all that was considered necessary for an active outdoor life like that of a farmer No doubt the desire for food came if they were given enough exercise, though he did not think the converse was true—namely, that the desire for exercise would be stimulated if they were given more food The most difficult part of the national scheme was to stimulate the appetite for a robust life, to inculcate pride in physical development

Lord BURGHLEY M.P, said that this country had lagged behind Germany and Scandinavia in inculcating the desire for fitness He agreed that nutrition was as important as games and exercises, but nutrition did not come within the terms of reference of the National Advisory Council on Physical Training, as a member of which he spoke It was its business first of all to provide playing fields, gymnasiums, and swimming baths A part of its work in which he was specially interested was propaganda. It had to overcome the inertia of people who said they were managing very well as they were and did not see the need for change It seemed to him that the task before the Council was not to try to develop in everybody the wish to become champions in a particular line of sport or games, but rather to suggest to the people of the country that they would be happier and better able to meet everyday demands by being fit The appeal which could be made to older people already set in their ways was very limited but something could be done to strike the imagination of the young

Disadvantages of Overdoing Athleticism

Dr ADOLPHE ABRAHAMS said that no doubt the part played by each of the numerous factors which contributed to health would in time be satisfactorily assessed by the distinguished authorities who had been appointed to the task and who would be able to make the necessary deductions for irresponsible enthusiasm While it seemed to stand to reason that exercise was necessary for fitness, he had more than once encountered a facile-tongued debater prepared with specious arguments to shake one's faith in what might be a rash generalization, and even to cast doubt whether exercise deliberately undertaken was of any value at all Whenever the problem of getting fit was submitted, he felt inclined to ask, "Fit for what?' A man might be fit to climb the Matterhorn, yet quite unfit to endure the responsibilities of city life, fit to row from Putney to Mortlake, yet unfit to undertake the duties of resident in a fever hospital And clearly the reverse held good Fitness meant satisfactory adaptation to one's environment whatever it was, and the part played by exercise in the determination and maintenance of that state was necessarily individual, varied, and limited There was no "best exercise" for everybody in all circumstances One man's pleasure was another man's madness Exercise which gave unqualified enjoyment to one inspired boredom in another and was torture to a third There was a tendency to assess the physical capacity of a nation by its exceptional athletes, who were often in the nature of phenomena or freaks, and as far from affording a criterion of national fitness as a Russian giant from indicating the average stature of his compatriots Athleticism was a very special quality, and its possession by no means signified health or strength, though it was not incompatible with them The training incidental to the production of the highest form of athletic efficiency had no place in a national enterprise It was a specialized undertaking with certain undesirable features and dangers which, however, were not grave if its limitations were accepted Many very great athletes were not merely delicate but actually unhealthy subjects The ideal upon which to insist would be a pride in the body, the production of a condition in which violent exercise played its part together with due regard to the elements of hygiene, of which youth was generally ignorant and still more often almost criminally careless A great deal of the evil attributed to violent exercise could be avoided by successfully encouraging in the adolescent the continuance of what was generally regarded as orthodox training into manhood and even middle age Doubtless this was an ideal more easy to advance than to practise, it demanded a vigorous discipline, and might be deprecated as tending to produce the physical neurotic unless a proper proportion was preserved The circumstances of life, especially among urban dwellers, opposed an ever-increasing difficulty He confessed he was disgusted to see a young man shirking the ascent of a short flight of stairs, the use of lifts by healthy persons under sixty ought to be an indictable offence! The eyes of legislators (Dr Abrahams continued) were upon the youth of other nations But national characteristics had to be realized On the Continent the inculcation of such principles was more easily achieved when temperamentally rules and regulations were more placidly accepted But at least we saw what we ought to aim at

The General Practitioner and National Fitness

Mr A E PORRITT agreed that any idea that this campaign should produce a race of super-athletes was to be deprecated There were extremely few of this athletically exalted category who were fit in the sense of Lord Horder's recent definition, 'health and happiness" But such athletes might well be used in propaganda—a light to which the humble moth might be attracted but from which it must also be protected, an example and stimulus to sound rivalry and orderly activities Mr Porritt urged the National Advisory Council to organize a medical advisory council To avoid unnecessary expense and reduplication of work, it might be recruited from medical bodies already existing—not public health bodies, State departments or specialist groups, but representatives of the general practitioners of the country Perhaps unfortunately the physical fitness campaign had been tacked on to the Government health campaign If they had to be connected should not the physical fitness campaign have come first? The best propagandist agents would be the people's doctors"

a nurse, so that the doctor's responsibility for its proper performance passed entirely on to her shoulders, is nearly always a question of fact based largely on recognized practice, and not a question of law A jury might conceivably, under the persuasion of a vigorous and skilful counsel, find that the anaesthetist ought to have asked the sister whether the patient had been properly prepared for the anaesthetic The balance of probability, however, is rather against their taking this view

The Coroner

The coroner is bound by law to hold an inquest on a person who seems to him to have died from an unnatural cause Some patients die under an anaesthetic from perfectly natural causes It is, however, difficult to decide which of many possible factors has caused the death of a given patient at an operation, and every registrar must, by order of the Registrar General, report to the coroner any death which has occurred at an operation or before recovery from an anaesthetic The coroner then has wide discretion to do what he thinks fit He may, if he chooses, order a necropsy and an inquest, but he will nearly always wish first to consult the medical men in charge of the operation and hear their opinions about the causes of death If he is satisfied that these were natural he will give permission for burial and do nothing more If he thinks a post mortem examination is necessary he will order one, and perhaps decide when he knows the result that an inquest is unnecessary Strictly speaking no citizen need notify any death to the coroner for the duty is laid by statute upon the registrar In practice however, the surgeon or hospital authorities inform the coroner of every death of a patient under an anaesthetic, whether a death certificate is given or not The coroner appreciates this courtesy Even if death is certified as natural no necropsy should be performed without his permission, for he may still consider that an inquest is necessary

Sydney Smith[1] says that the anaesthetist who is summoned by the coroner to give evidence at an inquest should prepare himself to answer the following questions

Was the anaesthetic necessary?

Was it the most suitable one to give under the circumstances?

Was the patient properly examined before administration and the condition of the heart, lungs and urine ascertained?

Was there no contraindication?

Was the patient suitably prepared?

Was the anaesthetic administered with due care?

What amount of anaesthetic was given and what was the duration of anaesthesia?

Were the necessary appliances for resuscitation at hand before commencing anaesthesia?

What treatment was actually adopted?

If the anaesthetist deals with all these points in his preliminary report to the coroner he will be giving that officer all the data necessary for his decision on what action to take and will save him much trouble

Burns and Anaesthetic Explosions

Burns due to the action of anaesthetic liquid on the skin mucous membrane or conjunctiva are fairly common The face is sometimes burned when the mask becomes saturated and liquid overflows on to the skin Some anaesthetists protect the patient's face with vaseline or oil, and the eyes with castor oil, some cover the face with an elaborate dressing and apply strapping to the eyelids Abrasion of the eye is an accident commonly met with during anaesthesia by the open method It may occur in three distinct ways (*a*) by the action of the liquid anaesthetic on the cornea or conjunctiva, (*b*) by the action of strong anaesthetic vapour, especially ether, when the patient is in a toxic or very debilitated state, (*c*) through over-handling of the cornea or conjunctiva by an inexperienced or nervous anaesthetist who feels that he must constantly reassure himself that the condition of the corneal reflex is satisfactory Every precaution should be taken to prevent anaesthetic liquid from entering the conjunctival sac, and many anaesthetists drop castor oil into the eyes to prevent trouble if it does When open ether is used it may be quite impossible to prevent a strong vapour reaching the eyeball, though every reasonable precaution should be taken Patients often injure their eyes by rubbing them as they come round To prevent this is part of the duty of the nurse, who should be with every patient who is under the influence of an anaesthetic

ILLUSTRATIVE CASE

In a case of injury to the eye which attracted a certain amount of attention some years ago the patient sued two medical partners for damages for loss of sight in his left eye An operation was performed in hospital for acute obstruction the patient was very ill and was on the table a long time One partner gave the anaesthetic and the other assisted the surgeon The anaesthetic consisted of two parts of ether to one of chloroform, and was given on an open mask a Gamgee pad being placed on the face This pad twice became so wet that the anaesthetist changed it When the patient came round he complained of pain in his left eye and some days later an ophthalmologist found that parts of the eye were very badly scarred The expert evidence showed that the condition of the eye was consistent with damage done by the anaesthetic also that liquid anaesthetic often entered a patient's eye but did not often harm it The damage here was quite unusually serious It was also fairly well established that liquid anaesthetic could get into an eye without any lack of care or skill by the anaesthetist The surgeon said in evidence that there had been an epidemic of anaesthetic eye at one of his hospitals in the preceding year the anaesthetics had been given by two highly experienced men who were absolutely certain that liquid anaesthetic had never entered any of the eyes Most of the patients had been in a septic condition, and the eye trouble had cleared up within two or three days except in one case where the eye had to be removed It was not quite clear from the mass of the evidence whether any anaesthetic had entered the present patient's eye but the concentration of vapour in the air had been very strong The patient was in an extremely toxic condition The jury failed to agree after two periods of retirement, and were discharged there is no record of a retrial of the action

Many anaesthetics are inflammable, and therefore apt to explode if they meet a red hot cautery or spark This risk was recently discussed in the *Journal*[2] Ether even when given by the open method is highly inflammable, but it is much more so when mixed with gas or oxygen Explosions have been caused by badly fitting endoscopic lamps In dry countries such as the United States, explosion due to the discharge of static electricity is a recognized risk tables and trolleys become charged by the friction of bedding and powerful sparks are produced The Joint Anaesthetics Committee of the British Medical Association and the Royal Society of Medicine recently requested the National Physical Laboratory to investigate this danger a full report is promised for early

of Wilson s disease, which almost invariably followed cirrhosis of the liver

Dr J LEWIS also read a paper on zinc protamine insulin in diabetes He did not advise the administration of ordinary insulin and zinc protamine insulin from the same syringe He described cases treated by zinc protamine insulin, and pointed out the necessity for careful adjustment over a period of from four to ten days during the process of changing over from the treatment with ordinary insulin to that with zinc protamine insulin In the discussion which followed the president, Dr E T FREEMAN suggested that the occasional appearance of glycosuria in the cases which Dr Lewis described might have been controlled by repeated blood-sugar estimations Professor HENRY MOORE described his experiences in the treatment of twenty-five cases with protamin zinc insulin The dosage was controlled by three blood-sugar tests within a period of twenty-four hours, and repeated later if necessary The results of treatment were most satisfactory He discussed the best time for the injection, the question of dosage, and other problems Dr G C DOCKERAY said that he had recently treated a boy, aged 7, successfully with the new insulin Dr S C WERCH Dr A THOMPSON and the President of the Academy, Dr A R PARSONS took part in the further discussion which followed and to which Dr LEWIS replied

SECTION OF PATHOLOGY

At a meeting of the Section of Pathology on October 22 the president Dr G C DOCKERAY gave his inaugural address on the histopathology of the endometrium

Endometrial Histopathology

Dr Dockeray dealt first with the preparation of sections from curettings, pieces of endometrium being fixed in Carnoy s solution for about three hours He discussed the microscopical findings in 500 consecutive curettings at the Rotunda Hospital In this series there had been only three cases of tuberculous endometritis He described the changes which were found in various forms of endometritis, many of which followed abortion He discussed the histological criteria of malignancy, and pointed out that the atypical squamous epithelium which was sometimes found in endometrial and cervical polypi might be wrongly diagnosed as malignant He made some reference to chorion epitheliomata, and went on to discuss the hyperplastic condition affecting the endometrium He had found the changes due to metropathia haemorrhagica in girls of 16 or 17, and also more often than the literature would suggest in the age groups between 20 and 40 He stressed the need for collaboration between the gynaecologist and the pathologist, and the importance of an adequate clinical history This same theme of collaboration was elaborated by Dr BETHEL SOLOMONS and the discussion was continued by Drs W R O FARRELL A W SPAIN J T WIGHAM J C FLOOD, and EDWARD SOLOMONS

At the same meeting Dr J MCGRATH showed a specimen of luteinoma from a patient aged 62 Dr NINIAN FALKINER said that this was a very rare condition, and asked if it were usual for it to appear so late in life Dr EDWARD SOLOMONS asked if it were possible to discover whether the cells in this case had been secreting corpus luteum hormone or not In reply Dr MCGRATH said that so far as he knew there were only two other cases reported in the literature and in this particular instance no biochemical investigation had been undertaken

---

At the November meeting of the Society of Public Analysts and Other Analytical Chemists, with the president Dr G ROCHE LYNCH in the chair a paper on the ascorbic acid content of fruits and vegetables was read by Miss MAMIE OLLIVER Variation in the ascorbic acid content of gooseberries black currants, strawberries, peas, potatoes, and asparagus had been studied by the micro method of determination with 2 6-dichlorophenol indophenol Tests were made at all stages of growth, the effects of degree of ripeness, time of picking and size of fruit were investigated, and in some instances the distribution of ascorbic acid in different parts of a fruit. The importance of representative sampling in such investigations was emphasized, and the need for taking account of all factors likely to affect the ascorbic acid content

New Maternity Hospital at Dunfermline

A new Maternity Hospital and Home, built by Dunfermline town council at a cost of about £30,000, was opened on October 30 It stands on high ground to the south of the burgh and has thirty-six beds There has been a maternity service at Davaar Home for the past seventeen years, but recently the facilities of this home have been found to be inadequate, and the town council resolved to erect a new hospital Lady Elgin, who performed the opening ceremony, said that it was satisfactory that Dunfermline and West Fife now had a fully equipped maternity hospital, because the maternal death rate in this district had caused anxiety to the community at large The town and county councils had a system of health visitors, and the people themselves had installed trained district nurses in every town and village

Benefaction to Edinburgh University

It was announced some time ago that a trust with a capital of £250,000 had been set up at Edinburgh University by an anonymous Scottish donor, who has recently been revealed as Dr John Donald Pollock of Boswell Road, Edinburgh The income from this fund is to be used for the benefit of students of Edinburgh University, and in addition Dr Pollock intends to donate capital to carry out the scheme The trustees are Dr Pollock, the Marquess of Lothian, Lord Normand, Sir Thomas Holland (Principal of the University) and Mr James Maxton It is intended that the income from the fund shall be used to provide further halls of residence, for the development of the Students Union, and for new playing fields The donor considers that the residential hall system and the further development of athletics would contribute to both the educational and the material well-being of Edinburgh students It is proposed to acquire suitable land within convenient reach of the University buildings which will include all the playing fields equipped with pavilions and dressing rooms Dr Pollock, a native of Galashiels, graduated M B C M at Edinburgh in 1892 and took the M D degree with honours in 1895 After holding resident appointments he settled in the West End of London, where he soon had a considerable practice Dr Pollock has also been successful in commerce He started a ship-

Pneumothorax Secondary to Mediastinal Emphysema

SIR,—In a demonstration which I was privileged to make at the Belfast Meeting of the British Medical Association I explained how, in the living anaesthetized cat, a mediastinal emphysema can be produced by prolonged overinflation of a local region of the lung such as occurs when a catheter is passed into the trachea as far as it will go and air is blown in through it I have shown[1] that air breaks through the overstretched alveolar bases which surround the arteries and veins, into the sheaths of these vessels, and that if the insufflation is continued the air bubbles dissect their way along the sheaths to the mediastinum, which becomes distended The air then *breaks through the mediastinal wall into the pleural* cavity, thus producing a pneumothorax If the insufflation is carried further the air continues to flow along the artificial passages in the vascular sheaths, from the area of local overinflation to the root of the lung and mediastinum, and out into the pleural cavity until the lungs are thoroughly collapsed and the pleural cavity greatly distended The site of the rupture on the mediastinal wall was demonstrated by seeing air bubbles from it after the chest had been opened, the parts immersed in water, and the mediastinum gently squeezed or more air introduced into it Visible fluids, as indian ink, were also used to track the course of the air in the mediastinal tissues to the break in the mediastinal wall

Emphasis is laid on the demonstration of this mode of production of interstitial pulmonic emphysema by overstretching the perivascular alveolar bases, and also on the conclusion that the vascular sheaths, under these conditions act as a highway for air, which is transferred along "false' passages, which the air bubbles make for themselves in the soft tissues to the lung root, mediastinum, and pleural cavity It is thought that this roundabout route of air passage may find a parallel in some of the hitherto obscure clinical cases, where no break in either the visceral pleura or the outer wall of the chest can be demonstrated

I have recently found histological evidence of the sites of the ruptures in the bases of the alveoli which wall in the vascular sheaths When hot gelatin containing fine carmine particles is injected through the original catheter, allowed to remain in place, into the part which has just been overinflated, and which is now collapsed, the entire lobe may be distended with gelatin When this is cooled, fixed, and sectioned it is seen that the vascular sheaths contain gelatin in addition to the air resulting from the overinflation This gelatin is often free from carmine particles Where they do occur they are seen as streams leading up to the alveolar bases and this suggests that the bases are ruptured at these points, allowing the carmine particles and gelatin to pass through from the alveoli into the vascular sheaths In places the aforementioned alveolar bases show lying upon them, on the alveolar side heaps and layers of carmine granules, and this suggests that here the gelatin has escaped into the sheaths through holes so small that they do not transmit the carmine grains It is felt that the course of the air through larger and smaller holes in the alveolar bases into the vascular sheaths is thus indicated This histological localization of the sites of air leakage from the alveoli into the interstitial tissue of the lung was reported at the meeting of the Anatomische Gesellschaft at Königsberg, E P, on August 25, and will be set forth in full in the *Verhandlungen* of that society at an early date—I am, etc,

Treatment of Cancer of Breast

SIR —Mr Henry R Thompson, in his letter published on November 6 (p 935), criticizes my statistical survey of results obtained in treating cancer of the breast with radium He points out that I have suggested that the results obtained in Group 1 (disease apparently confined to the breast) may be even better than the figures show, since some of the patients apparently in Group 1 are really in Group 2, whereas I have not suggested any correction in the opposite sense in Group 2 In support of his criticism he adduces figures derived from the clinical notes of patients treated at the London Hospital Here he finds that of 274 patients stated not to have infected lymph nodes before operation, 125 proved to have them on histological examination The error, therefore, appears to be no less than 45 6 per cent ! I had modestly suggested 27 per cent as a basis for a conjectural correction of my survival rate in Group 1 If this correction were to be raised to Mr Thompson s level my survival rate would be so fabulously good that I could justly be accused of introducing romance into my figures It is in fact plain that Mr Thompson s figures are derived from *such unreliable material that any criticism based on them* is inacceptable It is notorious that hospital records are apt to be misleading, since the clinical data are more likely to have been set down by a student or a hard pressed houseman than by a trained observer carefully carrying out a deliberate piece of clinical research

Mr Thompson is, however, justified in asking why I *did not suggest any correction for Group 2* There were two reasons for this In the first place, the main interest of the investigation centred round the more potentially curable patients in Group 1 Secondly, although the negative observation that ' no enlarged lymph nodes can be felt ' is likely to be sometimes erroneous in the stouter patients, the positive statement that "secondary carcinomatous lymph nodes can be felt" is far less likely to be wrong when made by a competent observer I do not in fact admit that I am likely to have made any appreciable error in assessing the patients in Group 2—I am, etc,

London, N W 3 Nov 8 GEOFFREY KEYNES

Treatment of Staphylococcal Infections

SIR —I read with great interest Professor J W Bigger s article on the staphylococci pathogenic for man in the *Journal* of October 30 (p 837) While I am quite unqualified to criticize the scientific aspects of his communication, certain statements he makes under the heading of treatment are in direct contradiction to my experience For thirty years I have been excising carbuncles situated in the usual position on the back of the neck and also on the buttock The operation is only undertaken when the stage of sloughing has set in, though the disease is still spreading at the periphery The excision is

vulsions were much more violent than those in the previous experiment, and the observers—Dr J F Ryan, Dr R F Woolmer, and Dr J C Buckley—considered them similar to those which they had witnessed in cases of so-called ether convulsions Dr W J Griffiths estimated the proportion of CO_2 in the bag to be 13 7 per cent at the end of the experiment

I realize that these experiments can only be regarded as preliminary investigations, as they were crudely executed and no estimations of alveolar or blood CO_2 were made They do show, however, that the presence of ether is not essential for the production of muscular twitchings with CO The precipitating factor in most cases of so-called ether convulsions—which should be called convulsions occurring during anaesthesia—is believed to be a raised CO_2 Certainly in their treatment the first thing to do is to allow the patient to breathe air freely and to take all possible steps to lower the alveolar CO As the individual response to CO is so variable every attempt should be made to prevent its piling up during anaesthesia, if this is taking place a close watch should be kept for any signs of CO_2 toxicity

With regard to Dr Human s last remark, I myself have never turned "a Boyle s ether bottle full on after the patient has been intubated under nitrous oxide anaesthesia," but I can picture that breath-holding would result for a sufficient length of time to give rise to muscular twitchings of both anoxaemic and excess CO_2 origin—I am, etc,

London, S W 3, Nov 8 M D NOSWORTHY

Ether Convulsions

SIR,—My father, the late Thomas Taylor of Bocking, Essex, who was house-surgeon at Colchester Hospital from 1840 or 1841 until 1850, used to tell the following story

Some time in the late 'forties a very fat woman, weighing 17 stone, was admitted for the relief of a strangulated umbilical hernia The senior member of the staff present administered ether Just as the operator was about to begin the patient had a convulsive fit and ceased breathing No one knew what to do, as the emergency was unprecedented After a hurried consultation it was decided that the method used for resuscitating an asphyxiated newborn child—that is, suspension by the heels and swinging to and fro—should be tried So with great difficulty the men present, the tall ones standing on the floor and the short ones on forms, managed to hold the huge fat woman up by the heels and swing her to and fro like a pendulum Their efforts were of no effect, however, and when all were exhausted the corpse was lowered to the floor My father said it was considered that this was the first death under ether to occur in England (Ether was first used for surgical anaesthesia in England in October, 1846)

What a subject the scene would have been for the brush of Hogarth!—I am, etc,

Formby, Lancs Nov 5 MARK R TAYLOR

A Forecast Fulfilled

SIR,—Prophets, even statistical prophets, are so frequently disappointed by events that I cannot resist the temptation to record a successful venture On page 287 of my book *Epidemics and Crowd-Diseases* published in 1935 the following passage occurs

> Some years ago in the course of a discussion I said that there was a good deal of evidence in support of the proposition that Edward Jenner was a rogue—as indeed there is and also a good deal (in my opinion a good deal more) of evidence against it. I shall no doubt always be quoted by some fanatics as having said that Jenner *was* a rogue

On page 197 of *The Vaccination Inquirer* bearing date November 1, 1937, the following passage occurs

> 'The Prime Minister opened the campaign on September 30 in a speech broadcast from the London School of Hygiene and Tropical Medicine A member of the staff of that school is Professor Major Greenwood who has made a thorough study of Jenner s and Creighton s claims and has come to the conclusion that there is no doubt that Jenner was a rogue

To save correspondence perhaps you will permit me to say that my forecasts of (1) the end of the war in Spain, (2) the number of deaths in the next epidemic of influenza, and (3) the winner of the Derby in 1938 are not yet ready—I am, etc,

London, W C, Nov 3 MAJOR GREENWOOD

Brown Bread versus White

SIR—Dr C O Stallybrass's letter in the *Journal* of October 30 (p 878) emphasizes the need for realizing the deficiencies of white bread, as so ably shown in your leading article of October 16 on this subject May I enter a plea for closer consideration of the benefits which can be gained from adding 20 per cent flour milled from soya beans to 80 per cent wheat flour? This mixture possesses all the physiological characteristics of dark whole meal flour, and bread made from it surpasses the nutritive value of bread made from whole wheat as well as being more palatable and tasty These qualities are due to the large amount of soya protein (glycinin), which is a complete protein containing all the essential amino acids necessary for the building up of proteins of the human organism In the above proportions of soya flour with white flour the protein of ordinary bread is increased by over 60 per cent

In the Far East millions of Chinese have for many centuries used soya flour as practically their sole source of protein, and we are far behind the U S A and Continental countries in our use of it There is some difference of opinion between British and American food research workers as to the vitamin content This is due to varying methods of technique whereby the oil in the bean being insufficiently eliminated during "processing" reduces vitamins A and D by rancidity All, however, are agreed that the valuable B complex vitamins are present in the flour in good quantity In 1920 the British Medical Research Committee listed soya beans as having + vitamin A and + + vitamin B

By reason of its lecithin content, of which soya flour contains more than any other vegetable food, the body can utilize the high fat content in soya in the organs and tissues instead of storing it in fat depots The ash of soya is alkaline while that of cereals is acid, the ash is rich in phosphorus, calcium, and magnesium Because of this alkaline value soya flour is specially useful in combating the fatigue of muscular exertion, and herein lies the Oriental s ability to do a long day s work at low cost The yield of protein pound for pound is more than twice that of beefsteak, four times that of eggs, wheat, and cereals, twice that of lima beans, and twelve times that of milk

The soya flour most commonly used in England is made in accordance with the formula of Professor Berczeller of Vienna From the point of view of nutrition and of social economics it has proved itself to be highly successful There is plentiful evidence to support Sir Robert McCarrison s views as to the intestinal disorders caused by the staple ingestion of bread deficient in both vitamins and protein, especially in our poorer classes, who cannot easily afford to make such deficiencies good by other articles of diet The widespread use of soya food in Japan

purpose Some, but not all, hospitals use a form by which the patient consents to the anaesthetic as well as the operation The question whether the anaesthesia and the operation can be separate assaults has probably never been raised at law If a patient has given his consent in writing to a specified operation, no court is likely to give him damages on the ground that he did not also consent to the administration of the anaesthetic It is an integral part of the operation, and his consent to it is necessarily implied The question might possibly arise over a trivial operation for which a general anaesthetic was not absolutely necessary If, however, the surgeon has told the patient he intends to give a general anaesthetic and the patient has had an opportunity of objecting and has not done so, he will in all probability be held to have consented Both the surgeon and the anaesthetist run a definite risk if the patient is arbitrarily anaesthetized for a trivial operation without being given the opportunity of objecting If an accident happens and he dies under the anaesthetic or suffers injury, both medical men are likely to have to pay damages, whether they have been negligent or not If an operation is urgently necessary and the patient is unconscious, and no relative or friend is available to give consent in his place, the emergency will justify the assault

It is possible that anaesthetists in general take the patient's formal consent to operation too much for granted If an aggrieved patient or his widow can show afterwards that he did not give consent to the operation the anaesthetist as well as the surgeon will have been guilty of an assault and will be liable to pay damages if the injury has been due to the anaesthetic these may be heavy If, however, the substantial injury has been caused by the operative procedure, the assault committed by the anaesthetist is probably a merely technical one and damages will at the most be nominal I have never heard of a case in which a patient suing a surgeon for operation without consent has also sued the anaesthetist—nor indeed, of one in which an anaesthetist has been sued for anaesthetizing without consent, but the risk is not an imaginary one When the patient is under 21 years of age he is a minor, and his parent or guardian must give consent for him

Liability for Nurses' Mistakes

Nurses sometimes make mistakes which lead to serious injury or death It is not often worth the while of a patient or his widow to sue the nurse for damages and he will therefore usually try to show that some medical man was responsible for her negligence The general rule is that the doctor is responsible for the negligence of his assistants If however the nurse is doing skilled work which may properly be delegated to her and the doctor is not in a position to supervise her she alone is responsible Here again the circumstances of the particular case are all important and there are no rules of law governing particular circumstances The principle is discussed in the leading cases of Pernonowsky v Freeman (1866 4 F and F 977) Hillyer v St Bartholomew's Hospital (1909 2 K B 820) and Anderson v Glasgow Royal Infirmary (1932 S.C., 245) The question often arises in cases of burning from hot water bottles and sometimes when a nurse has filled a bottle with the wrong anaesthetic fluid or given the anaesthetist a wrong bottle

Liability of the Surgeon

A question of great importance to the defence societies is whether a surgeon is unconditionally liable for the negligence of every member of the theatre team at an operation, including the anaesthetist The only legal basis for asserting that he is so liable is contained in the famous dictum of Lord Justice Kennedy in the case of Hillyer v St Bartholomew's Hospital to the effect that the moment the door of the operating theatre closes behind the theatre team they cease for the time to be the servants of the hospital governors, inasmuch as they take their orders from the operating surgeon alone The question at issue was whether the hospital governors were liable for an injury which a patient had suffered during an operation, and it was not necessary for the decision of that question that the court should express any opinion on the liability of a surgeon for the negligence of one of the theatre team Whether the surgeon is liable for the anaesthetist's negligence or not is, however, immaterial to the question of the liability of the anaesthetist Whatever the joint liability of the surgeon, the anaesthetist is responsible for his own errors Whether he is also responsible for those of the nurses assisting him depends on whether he may reasonably be expected to supervise them in the particular task in question

Surgeons sometimes prescribe a particular type of pre medication which will affect the anaesthetist's choice of an anaesthetic They occasionally go so far as to direct what type of anaesthetic should be used Some day a mishap may well result directly from this restriction, and the legal question of whether the anaesthetist is a completely independent expert or is a subordinate of the surgeon will have to be argued perhaps for the first time When a question is still unanswered by the decision of a court every person must answer it in his own way My tentative opinion is that as a matter of everyday fact the anaesthetist is independent and supreme in his own department and the law ought to follow this fact If this view is right, then the anaesthetist cannot shelter from legal responsibility behind these acts of the surgeon If he considers that any requirement of the surgeon will make the giving of the anaesthetic unsafe he must say so and decline to give it, or else take the risk and shoulder the liability In practice any particular conflict of requirements can doubtless be solved by co operation

Medical Protection

Claims are not made as often against anaesthetists as against surgeons but the anaesthetist's risk of being sued is substantial and constant Every anaesthetist should therefore be a member of one of the large defence organizations, so that if a patient claims compensation from him he may fall back on its experience and resources He will not only insure himself against damages and legal expenses but will also avoid serious anxiety and loss of time Moreover the experts of these bodies are much better qualified than he is to deal with the demands of a claimant's solicitors Finally anaesthetists are recommended to read the sections in Taylor's *Medical Jurisprudence* which deal with their legal position

I am much indebted to a number of medical and legal friends who have kindly helped me from their experience of these problems

T Hryntschak (*Med Klinik* August 13 1937) discusses the value of mandelic acid treatment in *B coli* urinary infections The usual preparation ammonium mandelate is often badly tolerated The author has therefore tried another salt, calcium mandelate and found it better tolerated and equally efficient Another well tolerated and efficient preparation is sodium mandelate which is given intravenously together with an equal amount of hexamine

charged Reporting in three days she showed no sign of shock, partial removal of the dressing revealed absence of sepsis and some progress in repair The case has been almost entirely ambulatory, and has only needed the superficial dressings to be renewed In twenty days from the date of accident the leg, now freed from protection, shows complete restoration of tissue with a slight discoloration as the sole evidence of a severe injury

The copper guaiacol sulphonate, known commercially as "burnojel," is easily spread by a bone spatula It is to its agency that the satisfactory results related are ascribed Unlike tannic acid, in its many forms of preparation this chemical produces no dark scab It seems analgesic, and adheres rather to the gauze than to the tissues A second case is now under similar treatment, and appears to make identical progress The initial application of the copper salt again exhibits the anodyne, antiseptic, astringent, and resolvent action already described—I am, etc,

Dublin, Nov 6 J SHIEL.

Obituary

Dr ARCHIBALD COWAN GUTHRIE, who died at his home in Harley Street on November 1, began his education at the Ayr Academy and studied medicine at the University of Edinburgh, graduating M.B, C M in 1887 He practised for twenty-five years, first in Leith and then in Edinburgh, before coming to London, where he took consulting rooms and held a civilian post under the War Office for the re-examination of men for the Army Dr Guthrie, who had no hospital appointments, was one of the first medical men in Harley Street to open a large private laboratory solely for the use of his patients He was one of the earliest to treat cases of tuberculosis with gold salts, and published a note on this form of therapy in the *Canadian Medical Association Journal* in 1917 He joined the British Medical Association in 1912, and was a Fellow of the Edinburgh Obstetrical and Medico-Chirurgical Societies, he had also served on the Council of the Royal Empire Society His wife, who died in 1930, was the daughter of Dr Paterson, at one time a leading member of the medical profession in Edinburgh He leaves two sons and a daughter One of his sons married the daughter of Dr F S Taylor-Thomas, well known in Australian medical circles

The death is announced of Dr SÖREN HOLTH whose operation for glaucoma and other contributions to ophthalmology have given him an international reputation He was born in Norway in 1863, and soon after qualifying as a doctor at the University of Christiania he began to take up ophthalmology A keen clinician and an enterprising and skilled operator, he was tireless in devising new operations and other procedures His own operation for detachment of the retina was soon eclipsed by the more reliable procedure of Gonin and his pupils, and Holth was one of the first to greet this treatment with approval His operation for glaucoma had a more successful career, and is indeed still considered in many parts of the world as the best of its kind Though many honours at home and abroad were bestowed on him, and he was invited to many parts of the world to demonstrate his operations he lived a fairly retired life, preferring scientific research and clinical work to public duties He published about 110 works on different aspects of ophthalmology and he conducted a large private practice in this subject till last year when increasing deafness due to otosclerosis forced him to retire One of the honours he most appreciated was membership of the Oxford Ophthalmological Society, to which he was elected soon after its creation

News has been received of the sudden death at sea, while returning on leave to England, of Dr JOHN ARCHER COWAN Government pathologist at Singapore He was born at Wigan on November 2, 1890, the son of R H Cowan, M R C S, and from Epsom College came to London to study medicine at University College Hospital After graduating M B, B S Lond in 1913 he was for a few months house-surgeon to the Royal Hospital, Richmond, and then joined the R.A M C in August, 1914, serving in France until 1916 with the rank of captain After the war he went to the Straits Settlements and was appointed Government pathologist at Penang, he obtained the D T M of Liverpool in 1929 Dr Cowan was chairman of the Penang Division of the British Medical Association in 1931–4, and after his transfer to Singapore was elected president of the Malaya Branch in 1935 He was a Corresponding Member of the Association of Clinical Pathologists, and contributed a paper on the Wassermann reaction in leprosy to the *Malayan Medical Journal*

We regret to announce the death on November 7, in his eighty-first year, of Dr REGINALD PRATT, consulting physician to the Leicester Royal Infirmary He was a student of University College, London, and qualified as M R C.S and L S.A in 1880, taking the M B Lond with honours in 1882, the M.D in 1884, and the M.R C.P in 1899 Dr Pratt had been a keen supporter of the Territorial movement, and for many years held a commission, retiring as lieutenant-colonel R.A M C (T) After the war he acted as medical specialist to the Ministry of Pensions He joined the British Medical Association fifty years ago, and in 1905 was chairman of the Leicester Division, serving also in that year as vice-president of the Section of Medicine at the Annual Meeting held in Leicester He was for three periods a member of the Midland Branch Council of the Association, and president of the Branch in 1910, he was also a past-president of the Leicester Medical Society and the Leicester Literary and Philosophical Society

Medico-Legal

DENTAL PRACTICE ON MEDICAL QUALIFICATION

The Court of Appeal dismissed on October 29 Dr C A Bynoe's appeal from the decision of Mr Justice Simonds, which we noted earlier this year[1] He is on the *Medical Register* and not the *Dentists Register* but had practised nothing but dentistry for thirty years, chiefly among insured persons He had treated a member of the General Federation of Trade Unions Approved Society and had sent in an account for £1 12s 6d on a "dental letter," the prescribed form The society had declined to pay because Dr Bynoe's name was not on the *Dentists Register* Regulation 21 of the Dental Benefit Regulations, 1930, provides that a member can obtain dental treatment from any dentist who is prepared to give it for certain fees Regulation 2 defines a dentist as a person whose name is in the *Dentists Register* Dr Bynoe asked the court for an injunction restraining the society from stating that he was not entitled to give dental services and be paid for them under National Health Insurance, but Mr Justice Simonds declined to grant it The Court of Appeal, after hearing him in person, dismissed his appeal *without calling* on counsel for the society The Master of the Rolls (Sir Wilfrid Greene) said he could well understand Dr Bynoe's feeling of serious grievance, unfortunately, that grievance was the result of legislation for which the court must assume that Parliament had had good reasons Registered medical practitioners were entitled to practise dentistry though not on the *Dentists Register*, but Parliament had thought fit to say that the dental benefit scheme

[1] *British Medical Journal* 1937, 2, 38

He was preceded by Dr W BENADE of the Geological Institute Berlin, who provided a useful classification of moors and their formation Dr SOUCI (Munich) also spoke on the chemical and physical action of peats showing that humus acids had an astringent effect on the skin which would tend to open the pores possibly facilitating absorption through the skin Dr VAN BENEDEN (Spa) also discussed their chemistry

Among other communications given in open session that of Dr LEO TRAUNER (Jugoslavia) was of great interest He discussed the relationship between instability of the autonomic *nervous system and rheumatic diseases Dr O GERKE (Austria)* described the effects of treatment with ointment containing radon from the natural springs of Badgastein This has been found useful for arthritic and skin conditions Dr G C. PETHER (Buxton) described the treatment of ankylosing spondylitis by plaster beds and exercises Numerous other papers were also read

During their stay in Germany the members were most generously entertained by the authorities and were enabled to visit the baths and research institutions in Ems, Homburg and other places The meeting next year will be in England

LONDON SCHOOL OF HYGIENE AND TROPICAL MEDICINE

In the report of the London School of Hygiene and Tropical Medicine for 1936–7 it is announced that the Right Hon Neville Chamberlain, now Prime Minister, has become Chairman of the Court of Governors in succession to the late Sir Austen Chamberlain The School is fortunate thus to retain a connexion with the Chamberlain family which dates back to the foundation of the original London School of Tropical Medicine through the efforts of Joseph Chamberlain in 1899

The present report illustrates the collaboration of the School with a variety of other bodies with the Ministry of Health the Medical Research Council the Industrial Health Research Board the London County Council the Royal Society with organizations such as the Society of Medical Officers of Health and the Association of Industrial Medical Officers with industrial organizations such as Imperial Chemical Industries As examples of collaboration with the Ministry of Health may be mentioned the work undertaken in the Statistical Division of the School on behalf of the Medical Intelligence Division of the Ministry and the responsibilities which the School has undertaken in respect of the laboratory maintained at Horton for the treatment of certain types of nervous disorder by means of malaria The work at Horton provides opportunities of observing the course of malaria in human beings under controlled conditions and of relating this with the studies carried out in the School on birds and monkeys in which malaria appears to be a natural infection

Research at the School in 1936-7

Researches carried out in the School cover a wide range The Divisions of Bacteriology and Biochemistry have continued to make satisfactory progress with their work on immunological chemistry Chemical fractions which appear to have effective immunizing powers have been isolated from the organisms of typhoid fever of whooping-cough and cholera and from certain strains of haemolytic streptococci and a point has been reached where the practical application of the results obtained with some of these organisms is in view The work appears to be of the utmost importance and indeed it may be anticipated that it will give a new direction to practice in relation to a whole group of infectious diseases The work on experimental epidemics in mice on which a report was published by the Medical Research Council last year has been continued Experiments at present in progress are designed to study the effects of variations in the duration of exposure to risk and they are being linked with studies on the effect of diet on the fertility and survival and growth of mice and on their resistance to infection

Professor G S Wilson, in collaboration with Dr F C Minett of the Royal Veterinary College and Mr H F Carling of the Berks and Bucks Joint Sanatorium has made a study of the relative value of raw and pasteurized milk for the feeding of calves The results suggest that pasteurized milk is not inferior in nutritive value to raw milk *With the aid of a grant from the Medical Research* Council an investigation has been made into the effect of bacteriophage in experimental infections, and the findings constitute the first clear demonstration that a bacteriophage may exert an effective protective action in an experimentally infected animal

In the section of industrial physiology work of some practical importance has been carried out on an air-conditioned cubicle suitable for use in tropical bungalows The cubicle which is portable is constructed of lightweight material effectively insulated and with a small air-conditioning plant it is capable of reducing tropical temperatures and humidities to reasonably comfortable *conditions The Institute of Agricultural Parasitology* whose work is closely related to the work in medical parasitology in the School has continued investigations on the prevention and treatment of helminth diseases and on parasites of economic importance

Work beyond Headquarters

A great deal of work has been carried out by members of the staff during the year outside London Professor Jameson assisted in a survey of schools and institutes of hygiene throughout Europe on behalf of the League of Nations Professor Wilson was a member of a group organized by the League of Nations to study conditions governing the production and distribution of milk in the countries of Western Europe with a view to discovering how far it is possible to implement the recommendation of the League's Nutrition Committee that more milk should be made available for infants and for other sections of the population

Work overseas has included studies of blackwater fever and macrocytic anaemia in Macedonia of onchocerciasis in cattle in the Malay States of *bilharzia in East Africa*, of problems relating to the control of malaria in India, in Nyasaland and in West Africa

During the year 211 students have taken courses in the School for diplomas in public health in tropical medicine and hygiene or in bacteriology New courses have been instituted on mental deficiency (to enable medical practitioners to qualify for recognition by the Board of Education as certifying officers so far as elementary school *children are concerned) and on the applications of* physiology and psychology to industrial problems

Through the Ross Institute the School is able to co operate in various ways with industrial undertakings that operate in the tropics Advice is given on matters affecting the health of European and native staffs and on the selection of medical officers for service overseas Courses of instruction are provided for non medical men on problems of tropical hygiene and sanitation and particularly on the control of *malaria This type of co operation* is important since measures of hygiene must depend for their success on securing the support of a body of well-informed lay opinion

From January 1938 the title of the official journal of the National Institute of Industrial Psychology will be changed from *The Human Factor* to *Occupational Psychology* In its new form the journal will be published quarterly instead of monthly The first number is due to appear in the middle of January

INTERDEPARTMENTAL COMMITTEE ON NURSING

As recently stated in the House of Commons an Interdepartmental Committee has been appointed by the Minister of Health and the President of the Board of Education to inquire into the recruitment, training, registration, and terms and conditions of service of nurses. The terms of reference to the committee are as follows

'To inquire into the arrangements at present in operation with regard to the recruitment, training, registration and terms and conditions of service of persons engaged in nursing the sick, and to report whether any changes in those arrangements or any other measures are expedient for the purpose of maintaining an adequate service both for institutional and for domiciliary nursing'

The committee will consist of the Earl of Athlone (chairman), Miss M Dorothy Brock, Litt D, Mr E. W Cemlyn-Jones, Miss Gertrude Cowlin, Mr Rhys J Davies, M P, Mr H A. de Montmorency, Sir Francis Fremantle, M.P, M D, Sir Arthur J Hall, M D, Mrs F A Keynes, J P, Miss Megan Lloyd George, M P, Mr C W Maudslay, Sir Frederick Menzies, M D, Miss E M Musson, LL D, Mr R H P Orde, B.A, Dr Gilbert E Orme, Professor R M F Picken, M B, Miss D M Smith Mr H S Souttar, F R C S, Dr W. Rees Thomas, Miss Frances Wakeford and Mr H M Walton

The secretaries to the committee are Sir Weldon Dalrymple-Champneys Bt, D M, of the Ministry of Health, and Mr W A B Hamilton of the Board of Education The Minister of Health has arranged for the services of his women inspectors to be placed at the disposal of the committee for the purposes of advice and inquiries on technical nursing matters All communications intended for the committee should be addressed The Secretary, Interdepartmental Committee on Nursing Services, Ministry of Health, Whitehall, S W 1

Universities and Colleges

UNIVERSITY OF OXFORD

Professor L J Witts M D F R C P has been appointed Nuffield Professor of Clinical Medicine

Radcliffe Travelling Fellowship

An examination for a Radcliffe Travelling Fellowship of the annual value of £300 and tenable for two years will be held at the University Museum, commencing on February 8, 1938 at 10 a m

Candidates must have passed all the examinations required by the University for the B A and B M. degrees They must not have exceeded four years from the time of passing the last examination required for the B M The successful candidate must before election declare that he intends to devote himself during the period of his tenure of the Fellowship to the study of medical science and to travel abroad with a view to that study The Fellowship will be vacated *ipso facto* by a Fellow who spends more than twelve months in the whole within the United Kingdom The examination will occupy four days Papers will be set in physiology pathology and preventive medicine, and a subject will be proposed for an essay there will also be a practical examination in pathology Any candidate desiring to offer in addition a special branch of either medicine or surgery must send notice of this to the Regius Professor of Medicine by January 31 Intending candidates should send their names addresses qualifications etc to the Regius Professor of Medicine University Museum by January 31

George Herbert Hunt Travelling Scholarship

The George Herbert Hunt Travelling Scholarship is awarded without examination every second year to a graduate in medicine of the University (of either sex) who has not exceeded five years from the date of passing the final examination for the B M degree The scholarship is of the value of £100 or such smaller sum as two years of the income of the Fund provides

Candidates are required to submit with their applications a statement of their academic record together with the testimonials (five copies) and an undertaking that if elected they will travel abroad for a period of not less than three months for the purpose of clinical study or research in medicine In making the award a preference is given to such candidates as express the intention of engaging in the practice of their profession either as surgeons or general practitioners The Scholar is required to complete his period of travel within twelve months from his election and within a reasonable period thereafter to submit to the Dean of the School of Medicine for the approval of the Electors a detailed report of his tenure of the Scholarship Payment of nine-tenths of the Scholarship is made to the Scholar on his signifying his readiness to proceed abroad and the remaining one-tenth on the approval of his report by the Electors. The next election will be made on April 9 1938 Candidates must send their applications to the Dean of the School of Medicine, University Museum Oxford by February 26 1938

UNIVERSITY OF CAMBRIDGE

The Faculty Board of Medicine has appointed Dr T S Hele Master of Emmanuel College Dr G S Graham Smith and Mr W H Bowen members of the M D Committee for the year 1938

UNIVERSITY OF LONDON

The Principal, Mr H L Eason, M S, F R C S has been appointed a member of the Committee of the Universities Bureau of the British Empire, and Dr W G Harnett a Governor of the Queen Elizabeth Grammar School, Barnet.

At a meeting of the Senate held on October 20, the degree of Ph D in hygiene (non-clinical) was awarded to Betty C. Hobbs of the London School of Hygiene and Tropical Medicine

ROYAL COLLEGE OF SURGEONS OF ENGLAND

The annual meeting of Fellows and Members will be held at the College in Lincoln s Inn Fields on Thursday, November 18, at 4 p m., when a report from the Council will be laid before the meeting. Fellows and Members can obtain copies of the report on application to the secretary, and can have their names placed on the list of those to whom it is sent annually A copy of the agenda will be issued to any Fellow or Member who may apply for one

BRITISH COLLEGE OF OBSTETRICIANS AND GYNAECOLOGISTS

At the autumn meeting of the Council, held on October 22, with the President Sir Ewen Maclean in the chair Dr George Gray Ward of New York was admitted to the honorary Fellowship of the College

The following were admitted to the Membership of the College

*Eric Bailache (Australia), Sudhir Chandra Bose (India), Marjorie Ruth Elizabeth Boyd (London), Francis Joseph Burke (Liverpool) Hugh Callagher (Australia) Isabella Cameron (London) *Jagadis pada Dutt (India) Phillip Joseph Ganner (Birmingham) *Edith Ghosh (India) Hartley Frederick Patterson Grafton (Canada), Charles John Kenneth Hamilton (Liverpool) Maurice Roberts Wilson Hart (India), John Howkins (London), *Mary John (India) John Godfrey Hastings Ince (London), James Walter Johnstone (Australia), *Mary Poonen Lukose (India), *Anna Pollock Martin (India), Laetitia Luzia Cornelia de Menezies (India),*Dhiremba Nath Mitra (India), *Olive Monahan (India), *Una Frances Marie Morton (India), *Baman Das Mukherjee (India), *Herbert Edward Murray (India), *Anath Nath Palit (India), *Nilkanth Anat Purandare (India), *Akhilanath Sarkar (India) *Manindranath Sarkar (India), George Albert Simpson (Canada), *Bawa Harkishan Singh (India) Arnold Bernard Stenhouse (London) *Padmanur Venkatagiri (India), Margaret Venters (Glasgow), Robert James Wotherspoon (Glasgow)

* In absentia

Dr T F Corkill of Wellington, New Zealand was appointed a member of the New Zealand Reference Committee

The following candidates have been awarded the diploma of the College after examination

J Baxter T A Best Beatrice A Blake, Eleanor D Blunt, S G Brook, W J Candlish R G Cooke, L H Copping J C Cuthbert C S France T N Hart, J A J Hammond A Hill H B Jennings, A N Jones G Limaye, I Magdi G B Marsden, H G Page J S Price J R Ritchie, J M Ross, M Salleh K W Stroude J R Taylor, Dorothy C R Vethavarnam, S D Vora, J M Watt

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH

A quarterly meeting of the Royal College of Physicians of Edinburgh was held on November 2, with the President, Dr W T Ritchie, in the chair

Dr Francis Esmond Reynolds (Glasgow) and Dr Charles Kelman Robertson (Edinburgh) were introduced and took their seats as Fellows of the College Dr J D W Pearce (London) Dr J P McGibbon (Edinburgh) and Dr W Melville Arnott (Edinburgh) were elected Fellows

The Hill Pattison Struthers Bursary in Clinical Medicine was awarded to Dr W Stuart Thomson and the Hill Pattison Struthers Bursary in Anatomy and Physiology to Mr A C Buchan

ROYAL FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW

At the annual meeting of the Royal Faculty of Physicians and Surgeons of Glasgow held on November 1 the following officers were elected *President* Dr John Henderson *Visitor* Dr J Souttar McKendrick *Honorary Treasurer* Dr James H MacDonald *Honorary Librarian* Dr W R Snodgrass, *Representative on the General Medical Council,* Mr G H Edington

the end of last year 244 authorities were providing meals and/or milk as compared with 224 during the preceding year Some provision is made in nearly all the areas where it is clearly needed, but its character and extent vary greatly The arrangements throughout the country do not yet reach the Board's standard of providing free food for all children who need it in order that they may profit by their education In some areas the arrangements for the discovery of under-nourished children are not yet complete, in others the income scales are too severe, and in others still the food, service and accommodation leave something to be desired Local education authorities possess all the powers they need and the Board hope they will use these powers even more in the future than they have in the past More departments of public elementary schools are providing milk under the milk in schools scheme In rural areas there are still difficulties of supply but by March this year nearly 93 per cent of the country's children were in departments operating the scheme Nevertheless less than half the children use the facilities open to them The chief reasons appear to be indifference in the parents and dislike of milk in the children Poverty is apparently not an important factor in most areas Probably if parents fully grasped the fact that milk is being supplied at half price and that children of all ages benefit by it many more would use the scheme Few will contest the Board's statement that ½d a day could not be better spent than in providing milk for a school child

Most areas make comparatively little provision for school canteens, though some authorities state that facilities will be provided as reorganization is carried out In some cases the dietaries are inadequate, and the Board is giving the matter close attention Play centres were conducted in the areas of forty two authorities 190 centres with a total average attendance of 53 525 children were conducted by thirty five authorities, and 109 centres with an average attendance of 18 800 children by voluntary bodies These centres have positive educational value, and also protect children from the dangers of the streets They depend for their usefulness on the supervision of skilled play leaders and are especially valuable when they provide for activities in both summer and winter The Board invites proposals for increasing their number

REFUGEE PROBLEMS IN SHANGHAI

The refugee problem in Shanghai is discussed by Dr R Cecil Robertson in an article in the October number of a Shanghai magazine *Oriental Affairs* a reprint of which has reached us Dr Robertson is head of the Division of Pathological Sciences of the Henry Lester Institute of Medical Research in that city He states that the refugees who poured into Shanghai at the beginning of hostilities were a subdued, apathetic people not panic stricken or disorderly The Shanghai municipal council decided on an intensive system of medical inspection of the refugee camps with a view to preventing epidemic diseases and supplying relief, and for this purpose the public health department was supplemented by voluntary medical workers and a large organization was rapidly built up

Evacuation and Medical Relief

The refugee problem cannot be considered independently of the hospital situation which was most perplexing. All hospitals and medical units over a large area of the city had to be immediately evacuated and transferred to other sites These included the isolation hospitals foreign and Chinese and three general or special hospitals Meanwhile a large number of emergency hospitals had to be established to deal with wounded soldiers for whom approximately 5 000 beds became available The volunteers of the public health department took over the work of medical relief in all the organized refugee camps in the International Settlement Strenuous efforts were made at the same time to facilitate the evacuation of refugees to other ports or places of safety in the interior but the numbers—never apparently exactly ascertained—in the organized camps were not greatly lessened as the evacuations and the fresh arrivals more or less balanced In a rough approximation the number in the camps in the International Settlement was 65 000 and in the French concession 25 000 In addition there were large numbers of unorganized refugees who settled on open spaces or in empty houses many of them very insanitary in their habits and constituting a menace to the health of the city

The Cholera Situation

The general health in the organized refugee camps Dr Robertson states has been well maintained Even with a fairly serious cholera epidemic raging the number of cholera suspects sent to hospital from these camps was only up to the time of writing (presumably September) 192 Inside the Settlement the cholera situation has been kept within manageable proportions owing to the free supply of Shanghai water works water Pure water is being provided for all refugee camps wells are disinfected twice weekly the worst of the wells being sealed up measures have been taken to suppress the fly menace and in addition intensive inoculation with anti cholera vaccine has been carried out. Dr Robertson writes that it is not anticipated that the cholera epidemic will assume large proportions provided great numbers of cases have not to be admitted from areas around the city where the inhabitants are using contaminated water supplies

Within the refugee camps the sanitation has been carefully supervised—a difficult task as many of the buildings used for the purpose have internal drainage systems quite inadequate to the necessities of so abnormal a population From the *medical and sanitary standpoint the refugee problem* has made certain measures urgent for the general safety of the area One necessary step is the provision of public latrine accommodation which has never been adequate in the International Settlement and has been almost entirely lacking in the French Concession

General Medical Measures

Dr Robertson adds that in addition to vaccination inoculation and general sanitary measures medical treatment has to be given for the minor ailments of a destitute and war stricken population The spread of deficiency diseases such as beri beri has also to be controlled by a suitable supplementary diet of cheap vitamin-containing substances With regard to tuberculosis the most that can be done at present is to try to prevent spread by diagnosing open cases in the refugee camps and ensuring that sputum is disinfected

The Shanghai refugee problem otherwise an unmixed evil has a bright side Never before has so large a Chinese population come under organized medical inspection or such a large measure of vaccination against small pox been conducted at one time in Shanghai There are many lessons to be learned from the present situation and it is hoped that some of them will bear fruit in permanent improvements in public health work throughout this commercial metropolis of China

M Girolami (*Rif med* September 4 1937) records four cases in patients aged from 24 to 37 of a condition characterized by the discharge of small quantities of blood in the sputum without demonstrable lesions of the respiratory system either on clinical or radiological examination Blood appeared in the sputum usually in the morning just as the patient was waking A good state of nutrition was maintained and as a rule there was no cough There were no obvious haemorrhagic lesions but the gums were slightly reddened cyanotic and swollen, and the fauces were red Bacteriological examination of the sputum showed a large number of spirochaetes Girolami suggests that the condition was due to a stomato pharyngitis of spirochaetal origin Treatment by arsenical preparations was successful in most cases

responsibility in the event of the illness or possible death of these young girls Major TRYON said he was sure there was no risk.

Radium Supplies—There is no world shortage of radium and purchasers do not experience difficulty in obtaining supplies This assurance was given by Lord Winterton on November 2, when he rejected a proposal for a committee to investigate possible sources in the British Isles or within the Empire

Maternity Accommodation in Llanelly—Sir KINGSLEY WOOD told Mr James Griffiths on November 4 that his attention had not been called to the decision of the management committee of the Llanelly General Hospital to close forthwith the hospital against the admission of maternity cases Mr Griffiths asserted that there was no hospital provision for the reception of maternity cases in the whole of the eastern portion of the county of Carmarthen including the town of Llanelly Sir KINGSLEY replied that he knew of the need for the provision of maternity accommodation in this area Arrangements were being made for a conference to be held at an early date between representatives of the Carmarthen County Council and the Llanelly Borough Council He would arrange, if the local authorities so desired, for a representative of his Department to attend

Total Milk Production—Mr W S Morrison furnishes the following table of estimated total milk production excluding milk fed to livestock, in England and Wales and in Scotland

	Millions of Gallons	
	England and Wales	Scotland
1931	1,286	163
1932	1 330	166
1933	1,366	170
1934	1 391	171
1935	1 408	174
1936	1,413	178
1937 (9 months)	1,063	140

The above estimates are based on the average yield of milk per cow as ascertained in 1930-1 and on the known changes in the national dairy herds

Notes in Brief

The Committee on the Consolidation of Local Government and Public Health Law is likely to present its report on the law relating to food, together with a draft Bill, about the end of this year

The original programmes submitted by local authorities under the slum clearance campaign involved the erection of 290 000 houses At the present rate this number will be completed within the next two years The programme has been considerably extended and Sir Kingsley Wood cannot suggest a date for the completion of the whole of the work

Recapitulating the steps taken by the League of Nations to assist Chinese authorities in organizing a campaign against epidemics Lord Cranborne explained that 1,370,000 Swiss francs would be applied to this purpose out of China s subscription to the League for 1937

During recent months the Ministry of Health has received reports of water shortage from twelve districts

Cases of impaired vision including those of total blindness which were accepted by the Ministry of Pensions as due to or accentuated by war service in each of the last three years numbered respectively 9 10 and 9 Wounds and injuries accepted for compensation or for any necessary treatment in the same years were respectively 456 393 and 386 A proportion of these cases represented effects of shrapnel which had previously caused no disablement.

In order to ward off influenza the owners of certain Durham collieries employing some 10 000 men and boys are supplying each man with a three weeks supply of iodized milk tablets

Medical News

The old students' annual reunion dinner of the London (Royal Free Hospital) School of Medicine for Women will be held at the Savoy Hotel on Thursday, December 2

The Glasgow University Club London, will dine at the Trocadero Restaurant, W, on Tuesday, December 14, at 7 15 for 7 30 p m, with Professor W Macneile Dixon, M.A, LL B, Litt D, in the chair Any Glasgow University men who, though not members of the club, desire to attend, are requested to communicate with the honorary secretaries, 62, Harley House, London, N W 1

The following medical men were elected mayors on November 9 Dr E P Drabble (Walsall), Dr R P S Edden (Beckenham), Dr W E M Ede (Worcester), Dr L G Glover (Hampstead), Dr O Wynne Griffith (Pwllheli), Dr H Harrison (Canterbury), Dr H Fitz-Neville Hine (Newark), Dr A J H. Iles (Taunton), Dr T Clyde McKenzie (Smethwick), Dr J S Soutter (Hedon), and Dr H Wood-Hill (Beccles) Dr Glover, Dr Griffith, Dr McKenzie, Dr Soutter, and Dr Wood-Hill were all re-elected

The Society for Cultural Relations with the U.S.S R is holding a soiree at the Bonnington Hotel, Southampton Row, London, W C I, on Friday, November 19, at 8.30 p m, to meet Dr N Waterfield, who has taken part in a recent tour of the U S S R as a representative of the British Medical Association All interested are invited to attend No ticket is necessary

The eighteenth Maudsley Lecture will be delivered by Professor F L Golla at the Royal Society of Medicine (1, Wimpole Street, W) on Thursday, November 25, at 3 p m His subject is "Science and Psychiatry" Psychiatrists and other medical practitioners, psychologists and members of the legal profession, teachers and students, *and all interested* are invited to attend *Admission is* without ticket

A meeting of the Royal Microscopical Society will be held at B M.A House, Tavistock Square, W C., on Wednesday, November 17, at 5 30 p m, when Mr J E Barnard, F R.S, and Mr F V Welch will give a communication on 'The Principles of Fluorescence Microscopy'

At the Royal Society of Arts on Wednesday, November 17, at 8 15 p m, Mr W W Wakefield, M P, chairman of the Organizing Committee of the National Playing Fields Association, will read a paper, illustrated by a cinematograph film, on "The Promotion of Outdoor Recreations" Applications for tickets should be made to the secretary, Royal Society of Arts, John Street, Adelphi, W C.2

The following meetings of the Tuberculosis Association will be held at 26, Portland Place, W, on Friday, November 19 4 p m, council meeting, 5 15 p m., general meeting and paper by Mr Lionel Pearson The Construction of the Tuberculosis Sanatorium', *8 30 p m.*, papers by Mr J E H Roberts Dr Maurice Davidson, and Dr Lee Lander, 'Bronchiectasis in Tuberculosis'

A meeting of the Royal Statistical Society will be held at the Royal Society of Arts, John Street, Adelphi, W C., on Tuesday, November 16, at 5 15 p m, when Mr R Huws Jones will read a paper on "Physical Indices and Clinical Assessments of the Nutrition of School Children"

The annual general meeting of the British Health Resorts Association will be held at 28, Portland Place, W, to-day (Friday, November 12) at 4 30 p m, with the president, Lord Meston, in the chair

The London County Council at its meeting on November 2 appointed Major H N Stafford, M B, D P H, coroner for the West London District, and R B Hervey Wyatt, M.B, D P.H., coroner for the East London District

clinical biochemist is held up for the same reason Dr A G Gibson, as honorary pathologist to the Radcliffe Infirmary, has become Nuffield Reader in *Morbid Anatomy*, with Dr A H T Robb Smith as assistant director The Committee has added a sum of £450 a year to the salary of the University Reader in Bacteriology so that the University has been able to secure in Dr A D Gardner a bacteriologist of professorial calibre Professor J A Gunn remains director of the Nuffield Institute of Medical Research with the title of Nuffield Professor of Therapeutics, and provision has been made for an additional graduate assistant in the Department of Pharmacology Other appointments, grants and provisions are recorded It is considered that it will be necessary to spend about £8,000 on radiological equipment A records officer has been appointed to supervise the complete system of clinical records and the follow up department which it is intended to institute

At a special meeting of Congregation on November 16 a decree will be submitted thanking Lord Nuffield for his additional gift of £200,000 to meet building costs in connexion with his benefaction for medical research Another decree will refer to his offer of £1,000 000, with site of the value approximately of £100,000, for the college for post-graduate studies In accepting the offer it will express the University's gratitude for this further munificence of a benefactor 'whose previous gifts have been without precedent in the history of the University'

Reports of Societies

TUBERCULOUS GLANDS IN THE NECK

At a meeting of the Section of Surgery of the Royal Society of Medicine on November 3 Professor G GREY TURNER presiding a discussion took place on the management of tuberculous glands of the neck

Mr CLAUDE FRANKAU said that before about 1885 caseating glands were usually allowed to burst and discharge Curettage of sinuses and occasional scooping out of superficial glands was the only surgery employed In succeeding years early operative intervention and eradication of the infected glands was advocated excellent results were obtained by a number of surgeons but on the whole the treatment was not satisfactory owing to a lack of understanding of the pathology of the condition and neglect of prophylaxis and after care During the last fifteen years the tendency had been to combine operative and palliative methods The infection was bovine in 90 per cent of cases The diagnosis in most cases was easy The speaker gave a classification of cases from the point of view of treatment In single glands not caseating non operative treatment was the line to adopt at first It was essential to eliminate foci of infection in the mouth and nasopharynx as far as possible, always remembering however that tonsillectomy might be followed by a flare up of the affected glands The patient should be placed in the best hygienic surroundings with the maximum amount of sun and fresh air violent exercise should be forbidden Of drugs he was old fashioned enough to think that cod liver oil and malt with in addition syrup of iodide of iron in moderate doses was most efficacious

Indications for Operation

In glands which were caseating early operation was essential before complete breakdown of the gland occurred This gave with care an insignificant scar The incision should be in the skin creases of the neck for the best cosmetic result Collar stud abscesses were a secondary and superficial manifestation of extensive disease in the deep fascia Aspiration was an unsatisfactory method and only palliative It should be reserved for cases in which the skin was reddened and to allow of an easier operation later With care an affected gland could be dissected out After-treatment was essential, and six weeks was the minimum to be spent by the sea or in the country to complete the cure and minimize the risk of future infection

When there were diffuse minor enlargements no operation should be undertaken unless caseation occurred in any individual gland when that gland alone should be dealt with Treatment should be on general lines In this type and in this type alone he had seen good results with x rays In the case of massive diffuse enlargements operation, apart from the evacuation of caseous material from time to time involved heroic procedures and should be avoided For tuberculin he had no good word to say and x-ray treatment although it did help in minor diffuse enlargements, could not have any effect on glands which were full of caseous deposits

Radium Treatment

Dr W T G PUGH referred to his experience of this condition during his twenty seven years as medical superintendent at Queen Mary's Hospital, Carshalton—a hospital for children whose condition necessitated lengthy institutional treatment Of the children admitted with tuberculous glands of the neck not one had previously had radium treatment, a few had been treated with tuberculin and he could recall only one who had previously had x-ray treatment and she was probably sent in because she had an extensive area of telangiectasis due to an overdose Only in the minority was the skin undamaged by scar or sinus At Carshalton open air treatment, heliotherapy and the like had always been available and most patients had benefited greatly Neither tuberculin nor x ray treatment had been used but in 1920 a small half-strength radium applicator was purchased and had been in use ever since With the use of radium the number of cases in which excision became necessary at once decreased Of over 1 000 consecutive cases half of them previous to and half subsequent to the purchase of the radium excision was carried out in 20 per cent of the *first half* and only in 5 per cent of the *second half* and he attributed the reduction entirely to the use of radium Radium caused the disappearance of early tuberculous glands and a shrinkage to fairly small fibrous nodules of those moderately diseased He considered that the greatest improvement in the future would be a general use of radium in the early stages

Dr B W WINDEYER gave an analysis of the treatment of tuberculous glands of the neck by radiotherapy at Middlesex Hospital since 1931 The larger number had been treated by radium alone and of 149 cases so treated the result was described as good in ninety improved in thirty six and unimproved in eleven while twelve patients had been lost The cases treated by x rays alone numbered twenty six with good results in eleven and improvement in three No attempt had been made to destroy the tuberculous process by radiation The object was to cause a local aseptic inflammatory reaction which would aid the general defensive reaction of the body and later assist the fibrous process of repair

Professor J PATERSON ROSS said that if surgery was to be undertaken it was important to realize that the operation was a big one The days when scraping of a tuberculous abscess was considered the right treatment had gone As regards differential diagnosis from such conditions as branchial cysts the question of whether the swelling was single or multiple was of importance if single it was likely to be a branchial cyst

General Discussion

Mr PHILIP TURNER said that after removing the glands he had tried a method of treating the enlarged tonsil by

the amount arising abroad whether it is remitted to this country or not If he enters into a deed or some other binding legal arrangement under which the lady in South Africa is given a legal title to some part of the income the amount of the annuity or annual payment made to her can be deducted and he will be chargeable only on the balance But apart from such an arrangement what is paid to her is a gift and not an annuity, and he is liable on the full income less the £25 allowance for a dependent relative

Purchase of Book Debts

"G S purchased a practice taking over the book debts at half their nominal value He has collected or will collect, more than he paid for them. Is he liable to pay income tax on that excess?

*** If G S wishes to adopt the basis of "cash receipts" it will be necessary for him to bring in the whole of the receipts from the work of the practice He can, however properly avoid paying tax on the excess in question by adopting the alternative 'bookings" basis In that case his first year s profits will be determined by the *value* of the bookings for the work of that year—that is, by their nominal amount less a reasonable estimate for the amount which he may be unlikely to recover

Temporary Resident—Dominion Income Tax

MELBOURNE came to the United Kingdom in March 1934, and has stayed longer than he intended His income is derived from investments in Australia managed by a trustee company there He has accounted for his liability to United Kingdom income tax for 1934–5—and apparently for 1935–6 also—but has since moved to another address, and the inspector of taxes who is now dealing with his liability requires evidence in the form of Australian assessment notices and receipts for the Dominion income tax allowance whereas the former inspector dispensed with that evidence Melbourne asks questions the purport of which will be seen from the following answers

*** (*a*) It is quite usual for the authorities to require such evidence but arrangements can be made for the probable amount of British tax affected to remain in abeyance for a reasonable period If the local inspector is not willing to hold in abeyance say the amount of the previous year s allowance, a request might be made to the Board of Inland Revenue Somerset House W C 2 (*b*) As 'Melbourne retains his Australian domicile—and in addition he does not intend to remain permanently in the United Kingdom—his liability is restricted to the amount of income remitted to this country (*c*) There is no limit to the time during which this applies except, perhaps, that a long residence here would constitute some but by no means conclusive evidence of a change of domicile and quality of residence

LETTERS, NOTES, ETC.

Members of the Royal College of Surgeons

Dr WINDHAM L GILLBARD (Park House Jeymer Avenue N W 2) writes At the annual meeting of Fellows and Members of the Royal College of Surgeons of England at Lincoln s Inn Fields on Thursday November 18 at 4 p.m Sir Bruce Bruce-Porter will move the motion That this forty seventh annual meeting of Fellows and Members of the Royal College of Surgeons of England again affirms that the Members who constitute 90 per cent of the College, should have some representation on the Council, a similar resolution having been passed forty five times and never once lost It is hoped that as many Members as possible will be present

Abdominal Examination of Children

Mr R GRAINGER F R C S (Berkhamsted) writes Screaming children too young to co operate in the search for signs of acute abdominal disease, have caused most of us a good deal of anxiety at times Muscular resistance is always present the localization of a tender spot is almost impossible and such procedures as rectal examination and the demonstration of psoas tenderness are met with a storm of protest which makes their value very difficult to assess While in no way suggesting that these examinations should be neglected I have for some time employed a test which has given important information not obtained by other means The test is original so far as I know but it is so simple that it must have been used many times though not previously recorded The abdomen is palpated gently with the child s own hand, and the sudden withdrawal of the hand when the point of maximum tenderness is approached leaves no doubt as to the seat of the trouble In my experience this method of examination gives the child confidence and is not resented at all, even though previous attempts at palpation in the usual way have resulted in nothing but screams This method was first used in the case of a deaf mute aged 5, who had an acute appendicitis and so far the youngest patient has been just over 2 In the case of acute inflammatory lesions the withdrawal of the hand as the affected area is reached is quite dramatic, and in the instances I have mentioned a positive result has been the determining factor in deciding to explore the abdomen without delay

Access to the British Postgraduate Medical School

Dr J MCNAMARA (Kensington W) writes When King George V opened the British Postgraduate Medical School in Ducane Road he expressed the hope that the school "with its happy union of ward and laboratory university and local authority drawing students and teachers from all parts of our Empire—and I trust from regions even more widely spread—may prosper under God s blessing. It would greatly facilitate access to the school and hospital to have a small railway station on the line which runs opposite to the hospital Such a station would considerably help towards the realization of the hope of the kindly King. When the Central London Railway was built the neighbourhood of Ducane Road was sparsely populated and there was no need for a station between Wood Lane and East Acton Now it is very much otherwise A great population has sprung up and thousands come and go in connexion with the school, the hospital, and the prison at Wormwood Scrubs A new station would pay the railway company and the company would doubtless erect one if approached by the proper authorities—namely the hospital staff, the University of London or the London County Council

Boots's New Booklets

Boots Pure Drug Company Ltd have just issued two pamphlets, one on sulphanilamide and the other on physostab," an anterior-pituitary like hormone corresponding to prolan B and prepared from human pregnancy urine Two more ambitious booklets of theirs are on protamine insulin with zinc and on ovarian hormones in clinical practice In both these new publications the recent literature is briefly reviewed and questions of dosage methods of administration and contraindications are discussed Copies may be obtained on application to the Wholesale and Export Department, Station Street Nottingham

A Warning

Mr SYDNEY TIBBLES (London W) writes A man called on me to ask for an appointment for his wife, giving a good West End address He then wanted to know what I thought would win such and such a race and on my saying I was not interested he offered to take my money to put on a certainty Needless to say his wife did not come, so that on thinking it over I wrote to the address given my letter was returned— No such person known here ' As he may have tried to get money this way from other doctors, I give his description About 5 ft 7 in in height clean shaven broad pale face wearing a dark suit, overcoat, and bowler hat , age about 40

Disclaimer

Mr ANTHONY PALIN writes It has been brought to my notice that certain dramatized and grossly exaggerated accounts have appeared in some week-end newspapers concerning a corneal grafting operation which I recently performed on a hospital patient I wish to say that these reports were entirely unauthorized by myself or by officials of the Bristol Eye Hospital

Control of Malaria Corrigendum

We regret that through a printing error the first line of Dr W M McDonald s letter on this subject (November 6 p 940) went astray, and in some copies of the *Journal* was replaced by the first line of another letter Dr McDonald s opening sentence should read Sir—In the *Journal* of August 28 (p 435) there appears a letter by Dr W F Cooper, in which he criticizes a letter from me in the *Journal* of June 5 "

children from Shetland, who often had to cross in stormy seas He was informed that only one of them was susceptible to sea sickness, and this was a child who was much afraid of the sea—obviously a psychological rather than a physical disturbance Mr STIRK ADAMS said that certain air pilots who practised upside-down flying found at first that they could not stay for more than one minute in the upside-down position, but later on they were able to stay for twenty minutes, and on righting themselves experienced a greater sense of disorientation than when they first assumed the abnormal position Mr SYDNEY SCOTT mentioned delayed sea sickness One man crossing from the Channel Islands to Southampton did not experience sea sickness until his train had nearly reached London Many people noticed the effect persisting for some time after disembarking Visual sensations probably played an important part Something similar might arise if one fished for a long time in a rapidly moving river

Dr MAITLAND said that every year he received some fifty or a hundred suggestions for the cure of sea sickness —drugs and appliances—but very few were of even occasional value, and even chloretone, one of the most effective was useless if taken indiscriminately Mr FORSTER mentioned one extremely susceptible person who combated sea sickness successfully by taking two or three grains of bromide and a little gin

THE SMALL INTESTINE

At a meeting of the Liverpool Medical Institution on October 21, with the president Professor R E KELLY in the chair, Sir EDMUND I SPRIGGS gave an address which he entitled 'A Clinical Study of the Small Intestine' Problems peculiar to peptic ulcer were excluded from the discussion, which was illustrated by Mr O A. Marxer's radiographs

Sir Edmund Spriggs said that the small intestine played a fundamental part in maintaining life and health It could be affected by general diseases such as tuberculosis by the extension of catarrh or more severe inflammation from the stomach the appendix, the colon or other adjoining structures and also by diverticulosis and by obstruction Clinically it was the special site of three or four diseases enteritis, which was common enteric fever which was less common and other conditions which were relatively rare—for example the coeliac group of diseases, regional ileitis and carcinoid tumours It appeared to have hardly any diseases peculiar to it, except perhaps the last two, and even they might affect the large intestine and the appendix respectively Of malignant growths it was said that there was one in the small intestine to seventy or eighty in the large

Sir Edmund then showed a table of the incidence of affections of the small intestine in Ruthin Castle in 8 547 patients acute obstruction and the complications of recent appendicitis were omitted The series showed 339 cases of duodenal ulcer also 103 cases in which gastro-enterostomy had been performed before admission most but not all seeking relief, and including thirty four cases of jejunal anastomotic ulcer gastro-enterostomy was done in another 100 cases at some time after admission There were 172 cases with duodenal diverticula seventeen jejunal, thirty two ileal, and a few showing Meckel's diverticulum In 322 cases adhesions were diagnosed Among other conditions were in order of frequency acute or subacute enteritis nervous diarrhoea coeliac disease and sprue duodenal ileus tuberculosis foreign bodies (mainly worms) regional ileitis intussusception and actinomycosis

Intestinal Diverticula

The jejunal diverticula were similar in nature to those occurring in the duodenum (Spriggs E I and Marxer, O A, *Quart J Med* 1925, **19**, 1)—that is, large, wide mouthed and, as a rule not subject to diverticulitis There were symptoms referable to the diverticula in fourteen cases—namely flatulence, nausea, eructation pain or discomfort and, in two cases haemorrhage The chief sign was intermittent distension, sometimes severe. Considering that in most cases it was not possible to remove the large pouches, it was remarkable that in many patients the symptoms yielded to treatment directed to keeping the pouches lubricated and healthy The diet should contain greens and fruit if well chewed or sieved Paraffin was given, and also *B acidophilus* kerol, sodium sulphocarbolate, and carminatives Three patients had been operated upon in one excision was done, in another a diverticulum at the duodeno-jejunal flexure was invaginated, with subsequent obstruction for which a further operation was needed, in the third a short circuit below a large number of pouches was successful, all the symptoms disappearing, while the haemorrhages ceased This last case had previously been published (*Quart J Med* 1925, **19**, 15)

There were twenty five cases of diverticula of the ileum These tended to be more like the small multiple diverticula in the large intestine In order to assess the symptoms arising from them other abdominal conditions were excluded In seventeen there was irritation with spasm and delay, the appendix being normal or absent The distension and discomfort was about the navel or at the right iliac fossa, with griping loose or irregular motions, local pain or tenderness, and *x*-ray evidence of diverticula The irritability of the pre diverticular state was observed in the ileum, especially in the terminal part but diverticulitis from inflammation of the pouches was rare, probably because the contents of the diverticula were soft and could easily be passed out Treatment similar to that for diverticulosis of the colon gave relief Two cases in which symptoms had been severe were described in detail, one had been seen three and one four years after the disappearance of symptoms

Regional Ileitis

Early tuberculosis of the ileum was not infrequently suspected but was difficult to recognize Eight more advanced cases were described, two being cases of terminal ulceration in phthisis, three were of tuberculous tumours affecting also the caecum, all of which had been excised successfully The symptoms and signs were contrasted with those of spreading appendicular inflammation and of neoplasm of the caecum Two other cases which had been regarded as tuberculous were in view of recent knowledge, classified as cases of regional ileitis or Crohn's disease This occurred mostly in young men and the inflammation of the ileum might involve more than one area The bowel became thick oedematous, and rigid and later fibrosed and narrowed with ulceration obstruction or fistula The speaker drew attention to the specks on the surface of the affected areas of ileum and to focal areas of giant cells which were seen on histological examination (Sproull J *Amer J Roentgenol* 1936 **36** 910) Both these features, which had given rise to a diagnosis of tuberculosis in some cases needed to be critically reviewed The general appearance of a lesion at an operation or the presence of giant cells on microscopical examination was insufficient evidence on which to base a diagnosis of tuberculosis in the absence of other signs—for example caseating glands demonstration of bacteria, or positive animal tests The acute symptoms were similar to those arising from the appendix (which had usually been removed) the subacute symptoms to those of chronic enteritis—namely loose stools loss of appetite and weight, and anaemia The signs were those of distension sometimes with a tender tumour and later of obstruction or fistula The condition had to be differentiated from tuberculosis and ulcerative colitis Two cases were described in detail in young men of 33 and 25 respectively, both of whom were operated upon

often bilateral and develops in a cortex which is already hypertrophied, and is most common in men between the ages of 50 and 70 In the majority of cases this condition is seen in patients who have suffered from cardiac lesions with hypertrophy of the heart, arteriosclerosis and atheroma, or from chronic disease of the kidney It would appear that there is a connexion between the adenomatous hypertrophy of the suprarenal and the hypercholesterinaemia which is often seen in these cases An increase in the number of basophil cells in the pituitary was noted in seven cases of suprarenal adenomata in which a detailed histological examination of the hypophysis was undertaken

385 Extravesical Cystalgia

Z ZELICOVICI (*J Urol med chir* August, 1937, p 140) draws attention to the number of women between the ages of 45 and 65 who complain of pain referred to the bladder with symptoms similar to those of cystitis The degree of severity may vary, but the onset is usually insidious with increasing frequency of micturition and pain Pain may vary in intensity in individual cases, it is felt during micturition, is usually followed by a burning sensation, and may radiate towards the perineum, the anus and the hypogastrium The urine may be cloudy, but is often clear and sterile, in which case the diagnosis is one of cystalgia rather than of true cystitis In the majority of cases some genital condition, such as long-standing uterine disorders, metritis, salpingitis, urethroceles, prolapse of the urethral mucosa, or polypus of the urethra, seemed to be responsible There are many cases, however, in which the cause of the cystalgia cannot be determined Treatment must vary according to the cause of the lesion When cervicitis is present electrocoagulation of the ulcers, followed by dressing the cervix with collargol ointment or antiphlogistine, has proved satisfactory, and douches of boracic lotion may also be prescribed Cystoceles may be treated by hydrotherapy, electrotherapy, and pessaries, unless the cystocele is so large that a colpoperineorrhaphy is necessary In cases of urethral inflammation, lavage of the urethra with oxycyanide of mercury and cauterization of the mucosa with a solution of nitrate of silver is the treatment recommended Details are also given of the method of treatment recommended in cases of cystalgia due to inflammation of the glands of Skene and Bartholin, to lesions of the urethra, or to polypi In cases of cystalgia of unknown origin pain is relieved by orthodox antispasmodic treatment

386 Exteriorization of the Large Intestine

P BERTRAND M ETIENNE-MARTIN and E CORATOD (*Lyon chir* July–August, 1937 p 406) consider that the exteriorization of the large intestine, by means of which a mobile segment is fixed outside the abdomen, is of value as an operative procedure of prudence and security, particularly in cases of cancer of the large bowel In order to estimate the respective values of different methods of exteriorization experiments were carried out on dogs and the results are given Operative technique must aim at ensuring the greatest margin of safety, and for this reason exteriorization should not be carried out in cases in which the tumour is adherent or infected It is also important that a sufficient length of intestine and mesentery shall be brought outside the abdomen so that the growth, with the adjacent glands, can be completely removed The operation consists of the exteriorization of the loop of intestine through a left iliac incision, but in cases in which the transverse colon is affected a median incision is indicated After closure of the abdominal cavity the mesentery is divided the affected portion of bowel resected and the two ends of the exteriorized loop are sutured together Resection may be immediate, fixing Paul's tubes in the cut ends of the bowel, or it may be done as a second stage at the end of a few days Exteriorization is indicated as an urgent procedure in cases of injury to the bowel, in acute infective lesions of the large intestine associated with peritonitis, in dysenteric perforation, and in acute sigmoiditis It may also be carried out in cases of acute obstruction due to volvulus of the large intestine or intussusception The procedure is further recommended for benign lesions of the large intestine and for cancer of the mobile portions of the colon It is not advised in cases of cancer of the right colon

Therapeutics

387 Prevention of Postoperative Thrombosis

C CRAFOORD (*Acta chir scand* 1937, **79**, 5, p 407) administered heparin postoperatively to counteract a tendency to thrombosis In the first series of cases it was found that this treatment prolonged the time of coagulation and also increased the tendency to bleeding in the area of operation The substantial fall in blood pressure, the increase in the pulse rate, and the rise in temperature which were observed in several cases may have been due to the large doses of heparin, especially as some of the preparations used were of a relatively low degree of activity It was decided to postpone further experiments until preparations of 100 per cent activity were procurable In the second series of cases, in which the preparations used were of a uniform degree of purity and strength, there were no post operative signs of toxicity It was found that the doses had less effect administered postoperatively than in normal cases In order to eliminate the risk of bleeding the first dose was not given until three hours after operation, but, as in two cases small subcutaneous haematomata were formed, it is proposed to lengthen still further the interval between the end of the operation and the first administration of heparin No signs of postoperative thrombosis or embolic complications were observed in any of the cases not even in one in which thrombosis had occurred after both a previous delivery and an operation Although the results have so far been satisfactory, it is considered necessary to try this treatment in a larger number of cases before any definite conclusions regarding its usefulness can be drawn

388 Mammary Abscess

R SOUPAULT (*Bull Soc Obstét Gynec Paris* June, 1937, p 444) strongly recommends the use of formol toxoid in the treatment of mammary abscesses In thirty lactating women mammary abscesses were resolved by this treatment without incision being necessary As soon as the patient was seen the centre of induration was punctured by a needle, and the pus or serous fluid obtained examined microscopically In nine cases out of ten staphylococci were found The patients were then given subcutaneously in the suprascapular region 0 25 c cm of formol toxoid, tested by the flocculation reaction Three subsequent injections of 0 5, 0 75, and 1 c cm were given at weekly intervals Satisfactory healing without residual scarring or induration was attained within four weeks, but streptococcal abscesses were not influenced Local reaction was minimal, but one case in four showed a sharp rise of temperature after the injection, and in about one half of the cases pus discharged through the puncture orifice In six women with early inflammatory conditions formol toxoid treatment was followed by non suppurative resolution within six to eight days

389 Serum Treatment of Pneumonia

N F NISSEN (*Ugeskr Laeg* August 5, 1937, p 825) reports from the Sundby Hospital in Denmark a study of the serum treatment of pneumonia carried out in conjunction with the State Serum Institute Between January, 1934, and September, 1935 the mortality from croupous pneumonia not treated with serum was 42 per cent In the autumn of 1935 a system of injecting Type I serum intravenously on alternate days was adopted The decision as to whether or not any given case was to be

Mr Cosbie Ross pointed out that a close survey of the literature revealed only thirteen cases of renal dermoids, and then described a case of his own

A male patient had had pain in the right loin sometimes of a colicky nature associated with occasional dysuria and slight nocturnal frequency. *x* ray examination revealed several shadows strongly suggestive of calculi in the renal pelvis. At operation the kidney proved to be normal except for the presence of a rounded, cystic swelling, about the size of a hen's egg, situated on the anterior aspect of the kidney beneath the capsule. The cyst was enucleated without the necessity for nephrectomy arising, and the patient made an uninterrupted recovery. The cyst in the wall of which calcareous plaques could be felt, was found to contain pultaceous matter, cholesterol crystals and fat globules but careful examination failed to reveal any epidermis or dermal glands.

Mr Ross then discussed the recorded cases, dividing them into two groups: those which by reason of the presence of hair or squamous epithelial lining could be positively identified as dermoid in character and those having many of the macroscopic attributes of the dermoid but lacking complete proof as to their origin. He included his own case in this second group. A third group of four cases was mentioned in which dermoid cysts had been found in the vicinity of the kidney but these were to be regarded rather as retroperitoneal dermoids. Mr Ross quoted Ewing as stating that while many epidermoid cysts were of traumatic origin, some well-defined forms were of embryonic derivation and produced characteristic tumours. Further, Ewing considered dermoids of the kidney to be due to epidermal rests derived from the Wolffian duct, and said that they might contain no dermal glands. If this authority were accepted, the second group of doubtful cases including the one under consideration, were to be regarded as true dermoid cysts of the kidney.

ADVANCES IN KNOWLEDGE OF MALARIA

At the opening meeting of the new session of the Royal Society of Tropical Medicine and Hygiene Colonel S. P. JAMES, F.R.S., delivered his presidential address on "Advances in Knowledge of Malaria since the War."

Colonel James began by saying that the twenty years which had intervened since the war were noteworthy first for the initiation and establishment of new and better arrangements for systematic research, secondly for certain remarkable discoveries, thirdly for a lively renewal of practical anti-malarial efforts in many parts of the world. An initial difficulty in creating and developing an anti-malarial service was that the countries concerned were poverty stricken and backward in matters of medical assistance and public health arrangements. The old question arose as to whether malaria among poor illiterate people should be dealt with as an isolated problem separate from the general medical and public health problems of the country concerned. Collective studies, especially those undertaken by the Malaria Commission of the League of Nations, had been productive of excellent results; malariologists from different countries representing different schools of teaching and practice had thereby been brought together to investigate local malarial problems on the spot. The International Health Division of the Rockefeller Foundation financed the Commission's work and also initiated and maintained from 1916 onwards an international arrangement of its own for systematic anti-malarial work in different countries, mainly directing its investigations to the particular methods for reducing the incidence of malaria infection such as anti-larval work, screening, and the treatment of carriers. Another advance had been the establishment in mental hospitals where malariotherapy was practised of research laboratories charged with the duty of cultivating malaria parasites in mosquitos and of inducing malarial attacks by the bites of these insects instead of by direct blood inoculations from patient to patient. This had opened up an entirely new field of research in the different countries such as England, Italy, Holland, the United States and Rumania where they had been established. The renewal of anti-malarial chemical research by the chemical industries in Germany and France and the organizations in Liverpool, London and Cambridge for testing new synthetic preparations were features of the period.

The results of the study of adult female mosquitos in the houses of malarial families were unexpectedly fruitful since they ultimately led to the discovery of biological races of anopheles indistinguishable morphologically in the adult stage, but with different habits and therefore sometimes with a different role in the epidemiology of the disease which they transmitted. Inquiry also showed that the apparent disappearance of malaria from England, Denmark and Holland had come about without any actual reduction in the insect vector concerned. Malaria was essentially a house or family disease and its spread was greatly facilitated by circumstances which brought gametocyte carriers, insect vectors, and non-immune persons into close and continuous association. In the countries named the chain of events had been broken in the course of years by progressive social, economic, educational, and public health improvements.

The method introduced by the late Dr Roehl in Germany of testing quinine and quinoline derivatives against the parasites of bird malaria had constituted a great advance in the study of malariotherapy, while the discovery of plasmoquine and other synthetic compounds was epoch making. On the histological side the vexed question of the unicity or plurality of the human species of plasmodia had been answered unequivocally. It was now universally accepted that the group comprised a number of species and that in addition there were many varieties of each species with lesser morphological differences as, for example, the indigenous types of *Plasmodium vivax* encountered in Holland and Madagascar respectively. It was also accepted that within each morphological species and variety there were many strains having different biological properties with different chemical effects, immunological characters, and reaction to anti-malarial drugs.

Malariotherapy excepted, no method of research had contributed so largely to new knowledge as the study of avian malaria. At the moment intensive study was being devoted to the completion of knowledge of the schizogonic cycle of plasmodia in their respective vertebrate hosts. What happened to the parasite during the interval between the inoculation of sporozoites by the mosquito and the appearance of tropozoites in the red blood corpuscles was still unknown. It had been found by Yorke and Macfie at Liverpool, and by James and his colleagues at Horton that the onset of a malarial attack induced by the bites of infected mosquitos could not be prevented by giving quinine during the incubation period whereas attacks produced by direct blood inoculation from a malarious patient could be so prevented. This led to the hypothesis of James in 1931 that the sporozoites after entering the circulation entered the reticulo-endothelial cells and there underwent a developmental cycle resulting in the production of merozoites which subsequently entered the red cells in the circulating blood. This theory received support from several different angles. Shortly, after the inoculation of sporozoites intravenously or intramuscularly into a host the blood became non-infective even in large amounts for at least two or three days. Yet in bird malaria though the blood at this period was non-infected emulsions of spleen liver and brain tissue were infective. Furthermore, certain avian plasmodia had been found to have two schizogonic cycles of development in their vertebrate host—one occurring in the reticulo-endothelial cells of the internal organs, and the other in the red blood corpuscles.

The lecture was accompanied by a demonstration by Colonel James of beautiful specimens illustrating the reticulo-endothelial phase of the life-cycle of certain avian species of malaria parasites.

version is an attempt to assist the deeper follicles to maturity and ovulation by facilitating their approach to the surface A wedge of tissue was excised sagittally from the cystic ovary, the apex being carried to the region of the hilum The cut edges were fully exposed and so sutured that the raw surface faced the pouch of Douglas and had no peritoneal contacts, in no case were there complications from post-operative adhesions Dilatation and curettage was performed before laparotomy In thirteen out of the seventeen patients regular menstruation was established, and Bailey asserts that, while recognizing the inadvisability of performing laparotomy in young subjects without a thorough trial of endocrine treatment, his operation is worthy of trial in those cases in which hormone therapy has failed, ovarian lesions can be clinically detected, and the patient s nervous system is adversely affected

397 Primary Dysmenorrhoea

LACKNER *et al* (*Amer J Obstet Gynec* August, 1937, p 248) studied primary dysmenorrhoea from its endocrine aspects Having demonstrated that the motility of the normal non pregnant uterus is increased by oestrogenic substances and diminished by progesterone, they conclude that exaggerated contractility of the uterus is the cause of pain during menstruation, and is due to a lack of balance in these hormones Moir suggested that menstrual pain coincided with a relative ischaemia of the uterus comparable to that of cardiac muscle in angina, an observation not confirmed by these authors' experiments Kennedy believed that degenerative changes in Frankenhauser s ganglion due to oestrin deficiency, caused the pain He therefore administered oestrin to increase uterine motility, whereas progesterone, which decreases uterine contractions, is used by other authorities As these are mutually exclusive hypotheses for therapeutic purposes, the authors attempted to demonstrate which of the two possible endocrine deficiencies caused dysmenorrhoea in given cases They used an intra-uterine balloon to obtain graphic records of motility, and made biopsies of the endometrium and hormonic assays of blood and urine Correlation of their observations with the results of the hormone treatment proved imperfect, although eight out of ten cases were relieved The study showed that, for therapeutic purposes progesterone, or a luteinizing substance which will stimulate its formation, relieves dysmenorrhoea in patients with large, well-developed uteri while hypoplastic uteri respond best to oestrogenic substances Further search for the actual cause of pain must be made through different channels and by other methods

398 Diet in Pregnancy

O BOKELMANN (*Med Welt* August 21 and 28, 1937, pp 1165 and 1202) points out that the healthy woman has a positive nitrogen balance at the end of pregnancy, and that the intake of proteins therefore should be restricted Lipaemia is the normal accompaniment of pregnancy, and while fats should be restricted, a plentiful supply of carbohydrates may be given Sufficient quantities of calcium and sodium chloride are essential, and lack of vitamins may produce serious effects on mother and foetus although the absence of vitamin A does not appear to have any effect on the latter In the mother habitual abortion night-blindness dental caries, puerperal tetany and osteomalacia are due to avitaminosis Children fed by mothers suffering from beri-beri soon develop the disease Severe avitaminosis D in the mother results in habitual abortion and in a lowered resistance to rickets in the child and avitaminosis E results in sterility Nearly all vitamins are found in milk and fresh vegetables but vitamins A B and C are especially found in fruits and potatoes During the puerperium the diet should be rich in proteins with some restriction of fats and carbohydrates and vitamins should be plentiful

Pathology

399 Small-pox Immunization

H YAOI (*Jap J exp Med* June, 1937, p 155) has found in rabbits that the development of immunity to small pox following vaccination is influenced and the time required for antibody formation is much shortened, by the simultaneous injection of a small amount of antiserum After cutaneous vaccination, antibodies were not detectable until after seven days, and maximum immunity was only attained after four weeks or more In the passive immunization of rabbits with immune goat serum, antibodies in the rabbit serum reached a maximum concentration in forty-eight hours and then diminished rapidly, finally becoming undetectable in ten to fourteen days When a small dose of immune serum was given intramuscularly at the time of cutaneous vaccination, antibodies appeared in the rabbit serum on the third or fourth day, and a maximum concentration was reached in seven days With moderate doses of immune serum similar results were obtained, but in some cases there was a delay in the antibody formation When large doses were given immunity failed to develop after the effects of the passive immunization had passed off, but if the vaccination was delayed to evade the period of maximum passive immunity then antibody formation occurred and immunity developed Small doses of immune serum given together with cutaneous vaccination hastened the development of immunity while large doses delayed or prevented it In man a simultaneous injection of immune serum at the time of vaccination only slightly modified the subsequent reaction The author suggests that simultaneous passive immunization and vaccination would be of value in the prevention of small-pox, especially during epidemics

400 Multiple Malignant Tumours

C DANIEL and D CARAMZULESCU (*Gynécologie* June 1937, p 337) discuss the occurrence of multiple malignant tumours, and record a case of sarcomatous degeneration of a uterine fibroid and an adenocarcinoma of the ovary existing together. While two benign tumours or a benign and a malignant tumour often occur together, it is rare to find two primary malignant tumours in different organs Some authors are of the opinion that a malignant tumour, far from immunizing the body, predisposes it to the development of others Primary cancers of different types rarely occur together, more commonly cancers of the same type occur contemporarily in different organs Primary malignant tumours occurring bilaterally have been explained on the grounds of simultaneous inoculation and as a coincidence in a 'cancerous diathesis The authors believe that animal experiment, biochemical examination of the blood, and endocrinology support the theory that in cases of multiple malignant tumours cancer must be regarded as a general and not a local disease

401 Diphtheria Antitoxin

Z TEVELI and K FEJES (*Arch Kinderheilk* July 20, 1937 p 174) immunized eighteen guinea-pigs against diphtheria by two doses of formol toxoid and eight weeks after the second injection inoculated the conjunctiva of each animal with cultures from ten diphtheria patients, with the result that all but one of the guinea pigs contracted conjunctival diphtheria The heart blood was examined both before and after infection In nine out of sixteen cases infection was followed by a diminution of the antitoxin, and in three the antitoxin content of the blood already present on the second day of disease was more than doubled Animals possessing only a low level of antitoxin had a severer attack of diphtheria than the others No relation, however, could be found between the increase or decrease of the blood antitoxin titre and the severity of the attack of diphtheria

These doctors could and did get into closer touch with the individual than any posters speeches, demonstrations, broadcasts Press articles, or the like could possibly do The great asset of the general practitioner which would remain after so much had been taken from him, was his intimate knowledge psychological and physical of the individual and the family In speaking of tests Mr Porritt said that many would be astonished if they saw how few of the patients seen in an out patient department were able to stand on one leg, even if it was a good leg Balance and co-ordination seemed to be absent He hoped that in arranging tests the soulless label 'physical jerks' would be avoided

Mr DOUGLAS LOWE (honorary secretary of the Amateur Athletic Association) said that if they sought in other countries something which they could apply without amendment in this country they would fail In Germany they had concentrated on games not physical training, but they had gone further—he thought much too far—in their campaign, and had aimed at being fit at all costs They had carried it too far by eliminating other sides of recreational leisure to which doctors at all events would attach the greatest importance If one took the population of Essen and compared it with that of Sheffield the comparison might not be found to the disadvantage of the English town, but so much was said and shown of the hikers in Bavarian sunshine and the like that the perspective was apt to be somewhat spoilt. He agreed with what Mr Porritt had said about the need for the co operation of the general practitioner Again and again when the honorary medical officer of the A A A was consulted by a young man who came to him complaining of a breakdown he found that the root cause of the trouble was that he had not gone early enough to his general practitioner

Sir HENRY GAUVAIN spoke from his experience at Alton with a special section of the community—the crippled—as to the remarkable value to be obtained from the three natural forms of treatment—namely, exposure to sunlight the use of fresh air with or without organized physical exercises, and sea bathing Sir WILLIAM WILLCOX mentioned the value of the physical training now being afforded to girls and women particularly, by the schools for operatic and ballet dancing This was a form of exercise which developed both muscles and mind, and it was amazing what keenness and sense of discipline the girls displayed He also put in a word for horse riding as bringing into use muscles not served by other forms of exercise and he further added that for perfection of physical function in any pursuit it was necessary to give up completely tobacco and alcohol

Dr ALISON GLOVER (Senior Medical Officer, Board of Education) mentioned the immense improvement in women, some of them of middle age which followed attendance at health and fitness classes coupled with a certain amount of dieting He also said that it was hoped that when the new college for physical training was established one of its most important functions would be courses for young doctors The discussion was closed with a few words from Sir HENRY PELHAM on behalf of the National Advisory Council who appealed for the co-operation of the medical profession The Council was looking to practitioners in general for substantial help especially through their interest in and guidance of boys clubs and organizations of a similar nature At the same time he rather deprecated one suggestion that had been made that there should be medical oversight of the tests employed he hoped that such supervision would be necessary only in selected cases and that in general these would be left to the teachers and physical instructors Finally he asked one question What was the medical profession doing to ensure that the men and women in the medical schools (most of them in big centres of population) had immediate access to suitable grounds where they could have games and exercises on the spot during the short intervals available in the working day?

ROYAL ACADEMY OF MEDICINE IN IRELAND

SECTION OF MEDICINE

A meeting of the Section of Medicine of the Royal Academy of Medicine in Ireland was held on October 8, with the president, Dr E T FREEMAN in the chair

Hughlings Jackson's Syndrome

Dr H L PARKER showed a case of Hughlings Jackson s syndrome following injury This syndrome was the result of the simultaneous destruction of the last four cranial nerves on one side Among the symptoms were paralysis of the soft palate, difficulty in swallowing, hoarseness, and regurgitation of fluids through the nostrils These symptoms were all present in his case and in addition there was anaesthesia of the tonsil and atrophy and weakness of one side of the tongue When the tongue was protruded it was deflected towards the paralysed side Any lesion in the retrocarotid space might involve the last four cranial nerves The most important cause was inflammation of the post-pharyngeal chain of glands possibly going on to form a retropharyngeal abscess The patient in the present case was a man aged 30 He was playing football and was struck on the postero-lateral aspect of the neck He continued playing but his neck was very sore, and that evening he noticed that it was swollen The following morning the swelling had increased, and the next day he was hoarse had trouble in swallowing, and fluid regurgitated through his nostrils He had received the injury twelve months ago, and since then there had been a slow and progressive improvement It was difficult to say what the prognosis in this case was, assuming the ordinary course of regeneration in the nerve fibres it would take a further six months or so before it would be possible to tell what was going to happen

Dr T O GRAHAM said he had seen two somewhat similar cases one of which appeared to arise spontaneously, while the other was that of a woman who fell out of a trap on her head and sustained a fracture of the cervical spine and probably also of the base of the skull Most of her symptoms had not appeared until late in life long after the accident, and appeared to be determined by arthritic changes in the spine Neither of these cases had shown any improvement at all The President of the Academy, Dr A R PARSONS said that he had been watching a case of Hughlings Jackson s syndrome for twelve years and during that time there had been practically no change in the patient s condition The patient could give no history which threw any light at all on the condition, her symptoms did not cause her any inconvenience Dr ALAN THOMPSON said that a condition such as this might be expected in a case of septic thrombosis of the internal jugular vein He had seen one case in which the nerves had been involved in a malignant growth extending backwards from the Eustachian tube along the base of the skull

In replying Dr PARKER said that most of the cases he had seen of this syndrome had been due to tumour, in women commonly haemangioblastomata He thought that phlebitis of the internal jugular vein could easily give rise to the condition

Other Communications

At the same meeting Dr R W F COLLIS showed a case of lenticulo striate disease following icterus gravis For the past year the child had shown choreiform movements in all limbs muscular hypotonia and some degree of mental deficiency There was no evidence of liver involvement and apart from the disorder of movement the child appeared to be physically well Dr Collis suggested that this condition might be related to hepato lenticular disease. There was some discussion in which Drs R E. STEEN H L PARKER and G C DOCKERAY took part as to whether the condition could be regarded as one

breaking company at Charleston Fife, which later undertook the raising of German war vessels at Scapa Flow The company prospered as Metal Industries Ltd Believing that oxygen was sold at too high a price, Dr Pollock resolved to set up a company with works at Rotherham for its production and became chairman of the British Oxygen Company

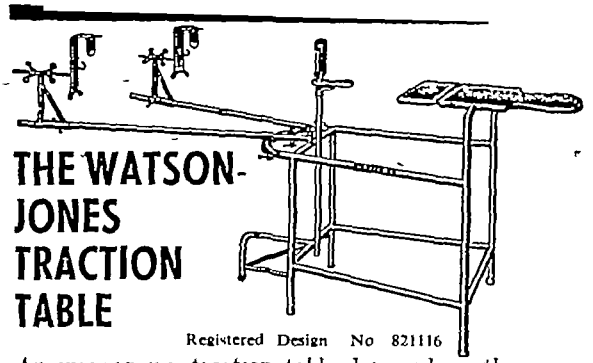
Psychiatric Appointments

Dr John C Anderson has been appointed physician-superintendent of Montrose Royal Asylum in succession to Dr C J Shaw, who is retiring Dr Anderson graduated B.Sc with honours at the University of Glasgow in 1921, and M B Ch B in 1923 After resident appointments at the Victoria Infirmary, Glasgow he was medical officer at the Royal Edinburgh Hospital for Nervous and Mental Disorders, and in 1925 was appointed senior medical officer and deputy superintendent of Montrose Royal Infirmary In 1929 he became assistant physician at the mental observation wards in the Eastern District Hospital, Glasgow, a post which he at present holds

At the meeting of Aberdeen University Court on October 22, Principal W Hamilton Fyfe presiding, Dr Douglas Robert MacCalman was appointed Crombie Ross Lecturer in Psychopathology to the University Dr MacCalman graduated M B., Ch B at Glasgow in 1929, and M D in 1933 After holding a post as resident in the Victoria Infirmary, Glasgow, he specialized in mental diseases, proceeding to Boston U.S.A where he was resident psychiatrist in the Boston Psychopathic Hospital He was later medical director of the Notre Dame Child Guidance Clinic in Glasgow, and subsequently practised in London

ENGLAND AND WALES

Medical Defence Union



At the annual meeting of the Medical Defence Union, held at 49 Bedford Square W C on October 28, the president Mr Eric Pearce Gould expressed the regret of all present at the retirement of Dr Henry Robinson from the responsible position of treasurer Some indication of the valuable services Dr Robinson had rendered to the Union was to be found in the capital increase of the invested funds during his term of office He occupied the post of treasurer for nine years and largely as a result of his foresight and advice the cash resources of the Union increased during that period from under £50 000 to approximately £100 000 The Union had been fortunate in choosing a treasurer who possessed the skill necessary to effect a result of this order A resolution was moved and carried unanimously expressing to Dr Robinson the Union's sincere appreciation of his services while acting as treasurer After the adoption of the annual report which included the financial statement and the solicitor's report, Messrs Hempsons were appointed solicitors for the ensuing year and were thanked for their past services The meeting concluded with a hearty vote of thanks to the president vice presidents and elected members of council for their voluntary services to the members of the Union At a subsequent meeting of the elected members of council Mr Pearce Gould was elected president for 1937–8 and Mr E D D Davis was elected treasurer

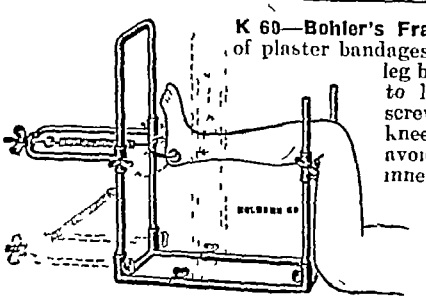
Lister's Mother

Lord Lister wrote at some length about his father John Joseph Lister notably his article in the *Dictionary of National Biography* and another more intimate article mainly on his father's achievements in microscopy which is included in the *Collected Papers* In the latter he described with filial pride his father's most rare modesty and Christian humility and said that he was "the most unselfish and scrupulously tender" of men But little has been known about Lister's mother, and the mothers of great men are perhaps more interesting than their fathers She was Isabella, daughter of Anthony Harris of Maryport, Cumberland where she was born in January, 1782 She married Lister's father in 1818, and died in 1864, five years before her husband Maryport, a little town on the Cumberland coast, the name and fame of which are due to the fact that Mary Queen of Scots landed there when fleeing from Scotland recently decided to commemorate two of its local celebrities Mrs Lister being one by placing memorial tablets on the houses in which they had lived The other celebrity was T H Ismay, founder of the White Star Line and there is this connexion between the two, that while Ismay took a great part in expanding the British mercantile marine, Isabella Harris's father was a master mariner of Cumberland and her mother the daughter of a master mariner of Dublin Dr J W Crerar of Maryport formerly of Edinburgh who has been conducting some researches into local history has discovered that Isabella Harris was born at No 28, High Street and on this house accordingly the urban district council has placed a tablet, which was unveiled by Sir John Fraser, Regius Professor of Clinical Surgery, Edinburgh University, the fourth occupant of that chair since Lister himself filled it from 1869 to 1877 Sir John Fraser said that he felt it a great privilege, by honouring Lister's mother, to pay a tribute to the memory of her distinguished son, who was ranked among the immortals and whose service to humanity could not be put into words He believed that the bond between Lister and his mother was very close It was true that there were not many references to the subject in Lister's letters which had been preserved, but he thought he knew the reason There were some things in life too intimate and precious to be written about or discussed, for they were locked in the innermost recesses of the heart Lister and his Quaker mother were not the sort of people to show their feelings to the world, and the absence of reference was perhaps an evidence in itself of the bond between them Isabella Lister was a remarkable woman One had only to look at her face in the existing portrait to appreciate her gentleness and thoughtfulness Lister himself was one of the kindest and gentlest of men, and in great measure, Sir John Fraser considered, he must have owed this side of his character to his mother Had her mould been less fine her son might not have attained the position of being acclaimed as one of the saviours of mankind One interesting light was thrown upon her character from an outside source She left Maryport with her mother for Ackworth in the West Riding where her mother became the headmistress or superintendent of the Friends School and when presently Isabella left to be married to Lister the governors of the school expressed their gratitude for her valuable exertions in endeavouring to instruct the children in the paths of virtue and religion and to promote the peace and harmony of the family Maryport Sir John Fraser added did well to testify to its pride in having furnished the early surroundings of Isabella Lister who gave to humanity one of its greatest benefactors

Large Bequests for Medical Purposes

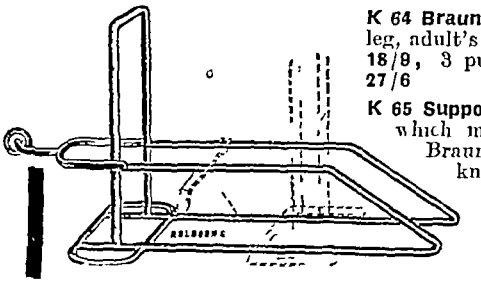
The bequests of Mr George Edward Henderson of Newcastle upon Tyne who died on July 15, leaving £1 327 412 with net personalty £1 295 224 include £2,000 to the Royal Victoria Infirmary Newcastle to endow two beds, £2,000 to Newcastle Hospital for Sick Children, to endow two beds £1 000 to the British Empire Cancer Campaign £500 to the Newcastle Eye Infirmary, and, after allowing for various other bequests three tenths of the residue to the University of Durham College of Medicine for a George Edward Henderson Fund for the promotion of medical science and for the general purposes of the College three tenths to the Royal Victoria Infirmary for a George Edward Henderson Fund to be applied for general purposes, and four-tenths to Armstrong College

THE WATSON-JONES TRACTION TABLE



Registered Design No 821116

An inexpensive traction table designed on the simplest possible lines for plaster work and hip operations Every unnecessary joint, bar, and screw has been discarded and framework removed as far as possible from hip to facilitate towelling and aseptic technique and to avoid interference with both lateral and antero posterior radiography

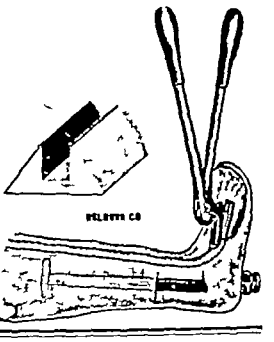


Tubular steel frame with shoulder platform adjustable in length pelvic support in two sizes of aluminium permeal post of lignum vitae, faced with sponge rubber pad, leg extension bars and foot pieces mounted on stump feet with rubber shoes

K 125 Model A Frame, finish in aluminium bronze with leg extension bars and quadrant nickel plated **£21 0 0**

K 126 Model B Portable Type, as above but with frame made to take apart entirely chromium-plated **£29 10 0** Can be packed **to carry in back of private car**

K 60—Bohler's Frame For the application of plaster bandages in fractures of the lower leg bones, adjustable according to length of the limb, with screw traction and special knee support designed to avoid flexor tendons on the inner side of the knee, tubular steel, aluminium finish, each **£3 3 0** Ditto, dull plated finish, each **£3 15 3**



K 64 Braun's Splint For the lower leg, adult's or child's size 1 pulley, **18/9**, 3 pulleys, **22/6**, 4 pulleys, **27/6**

K 65 Support, adjustable in height, which may be placed over the Braun's Splint for flexing the knee, indicated by dotted outline, metal, aluminium finish, each **12/9** Dull plated, **18/6** Ditto, wooden, **19/6**

INDIA RUBBER CHANNEL STRIP

For use under plaster of paris bandages to facilitate removal by providing a channel for blade of shears Price, **1/9** per yard **18/-** per doz yards **£5** per 100 yards

complete, and must be carried out beyond the area of necrosis, this entails a very wide removal of skin, as the subcutaneous fat is invariably affected much more widely than the overlying skin The resulting wound is a saucer-like one of large extent, sometimes four or five inches in diameter

Long experience has convinced me that general dissemination of the infection does not take place, that, on the contrary, the operation gives immediate relief from pain and septic absorption This is shown by the fact that if the temperature is elevated at the time of operation it falls to normal within a few hours and remains there I can recall only one death, and that more than twenty five years ago, in a very ill patient with glycosuria, and in only one patient have I seen any complications She had femoral thrombosis, with some small pulmonary infarcts The rule is a dramatic relief from pain and misery The large wound soon fills up with granulations, and forms a flat, granulating area, which heals in rapidly, a process which may be hastened with a Thiersch graft I do not claim a reduction of mortality by this method of treatment—carbuncles in these situations usually recover spontaneously—but I do claim a great reduction in suffering and healing in about the same time as if the case were treated on conservative lines

The problem is quite different from that of carbuncles of the face On the back of the neck the fat is relatively avascular and fibrous, and the deep fascia is strong and forms a sure defence against deep spread of the infection In addition, complete excision is easy on anatomical grounds In the face we are dealing with a very vascular area with feeble deep fascia, and with veins communicating with the intracranial sinuses and meninges along which infection easily spreads It is well to remember that a fatal outcome is not uncommon even when surgical incisions are avoided Finally the anatomical conditions prevent any attempt to excise the lesion

I would suggest that for carbuncles in the regions I have indicated one of two lines of treatment may be adopted (*a*) non operative, (*b*) excision Any intermediate course such as incision, crucial or simple, is futile, as anyone who has excised a carbuncle must know There is no liquid pus in a cavity to drain There is a central area of slough surrounded by hundreds of tiny loculi containing pus Incision cannot possibly drain these effectively —I am, etc,

Manchester Nov 5 GARNETT WRIGHT

Prophylaxis of Ophthalmia Neonatorum

SIR —Between January 1 and May 15 1937 of 644 babies born in the Bowring Civil Hospital Bangalore eight developed gonococcal ophthalmia Since May 15 of 740 babies only one has been affected in this way, and the condition yielded satisfactorily to the routine treatment as carried out in St Margaret's Hospital London Up to May 15 a 2 per cent solution of silver nitrate was used as a prophylactic but on that date being dissatisfied with the results I changed the method to the following As soon as the baby's head is born the eyes are wiped and a few drops of 10 per cent argyrol are instilled into each the process being repeated when the baby is bathed about an hour later and again on the first five mornings of its life

I think that some of the virtue of argyrol lies in its dark brown colour as the nurse can see whether the solution has actually entered the child's eyes This is not always possible with the colourless silver nitrate solution especially during rush hours and at night As the subject is an important one it would be interesting to have the views and experience of others who are dealing with large numbers of newborn children For instance, a point that occurs to me at once is whether flavine in castor oil which is such a good remedy is an equally good prophylactic —I am, etc,

Bangalore Oct 25 H WILLIAMSON Lieut Colonel I M S

Spinal Anaesthesia for Caesarean Section

SIR —I have followed with considerable interest the discussion in the correspondence columns of the *Journal* on spinal anaesthesia for Caesarean section In 1930 Professor Sebrechts emphasized the importance of using a smaller dose of spinal anaesthetic when operating on full term pregnant women *Nous avons remarqué depuis longtemps au cours de tres nombreuses opérations césariennes qu'il est nécessaire de réduire la dose normale d'anesthésique sous peine d'accidents graves*

My own experience of Caesarean section is not very extensive, but tends to confirm Sebrechts's view that these patients are 'rachi sensible,' 2 c cm of duracaine giving excellent anaesthesia without causing any anxiety. In order to secure more prolonged anaesthesia an increased dosage was employed for two cases of pregnancy complicated by carcinoma of the cervix, in which a Wertheim's hysterectomy was done as well as Caesarean section For the first case 3 c cm of duracaine was given This patient was in labour at term, and the anaesthetic was entirely satisfactory In the other case a seven-and-a-half months pregnancy 14 c cm of percaine was injected, and though this is quite a large dose the anaesthetic gave out at the end of one hour, and the operation had to be completed under ether If it is true, as I believe that full term pregnant women are more sensitive to spinal anaesthesia than normal patients this may provide an explanation for the conflicting opinions expressed by your correspondents In the majority of letters the dosage used is not mentioned it would be interesting to know if those who advocate the method are in the habit of using smaller doses of the anaesthetic than those who condemn it —I am etc,

Lincoln Nov 6 G A BAGOT WALTERS

Risks of Anaesthesia

SIR,—My original remarks on the convulsive properties of carbon dioxide were based on various reports which have appeared in the literature In order that I might reply promptly to Dr J U Human's letter (*Journal* November 6 p 937) I submitted myself to the two following experiments

Yesterday I inhaled from a bag containing oxygen into which carbon dioxide was continuously added Consciousness was not lost but the hyperpnoea was most exhausting. My limbs soon became spastic and exhibited coarse clonic movements The experiment was then terminated and the movements subsided after a few breaths of air had been taken It was suggested that the hyperoxygenation might have rendered me more susceptible to the action of CO and that the extreme muscular effort—expended in breathing so deeply—might have played some part in the production of the convulsive movements Accordingly a further experiment was carried out to-day in which an approximately 80 20 per cent helium oxygen mixture was substituted for the oxygen in the bag. Sufficient oxygen was then added with the CO_2 to avoid any possibility of anoxaemia On account of the low density of the helium my muscular efforts were considerably less than those in the previous experiment although the hyperpnoea was judged to be greater This time the twitchings began in the eyebrows but soon spread to the rest of the body The experiment terminated before loss of consciousness and the free breathing of air again corrected the condition These con

QUICK AS AN AMBULANCE—

In emergency cases the opportunity of an X-ray examination is frequently the means of saving a patient's life In other serious cases too, examinations carried out in the patient's own home are of the greatest possible value

Within forty minutes of the arrival of a PORTABLE X-RAY Service Car, negatives are ready for inspection More and more doctors are now using PORTABLE X-RAY Cars for visiting private homes, nursing homes, and hospitals

MAW STEROTHERM

HOT AIR ELECTRIC AUTOMATIC STERILIZER

Patent No 427581

Maw Sterotherm Automatic Sterilizers have been installed in the London, Westminster and many other Hospitals Surgeries, etc, throughout the country and are functioning with the utmost efficiency The special features of the Sterotherm ensure complete sterilization of Instruments, Dressings, Oils, etc, by the Hot Air method It is the ideal unit where economy of space and outlay are essential

May we send you details or arrange a demonstration ?

SPECIAL FEATURES

- Efficient Sterilization
- Automatic regulation of temperature.
- No supervision necessary while in use
- Very small current consumption
- Articles in apparatus remain sterile until required, as closure is bacteria proof
- Dressings quite dry after leaving Sterilizer
- Convenient size—length 16½ in diameter 9½ in

PRICE **£20**

and China down the ages, and the example of other countries that consume it in annually increasing quantity, are factors that should lead us to a better appreciation of the high nutritional qualities of this legume—I am, etc,

Edinburgh Nov 1 G DOUGLAS GRAY

Post-mortem Examinations in Inquest Cases

SIR—I am prompted by the letter of Dr Iris M Cullum (*Journal* October 16, p 778) to relate an experience I had of a coroner's investigation while I was acting as a locumtenent recently in an English town My own case involved even wider issues than those discussed by Dr Cullum, but both cases I believe touch on a sore point—namely the freedom with which a coroner may unconsciously damage a medical practitioner's reputation and yet himself remain immune from censure

I had been called by a midwife to see a young married woman in labour Two days previously the woman had had a fall and since then had felt practically no foetal movements She was nearly at term and when I saw her had been in labour for eighteen hours On examination I found the head floating free in the pelvis the foetal heart sounds were barely audible and were at a rate of between 80 and 90 a minute I informed the woman in the presence of the midwife that her baby would in all probability not survive the birth Under anaesthesia I found the cervix fully dilated the membranes unruptured and the face presenting I ruptured the membranes converted the face to a vertex presentation and in two hours the woman delivered the child by her own forces The baby was barely alive at birth and despite the usual stimulants died within a few hours I signed a death certificate giving as the immediate cause of death birth trauma

Then things began to happen Unknown to me a police officer visited the woman—this on the day following a difficult labour—questioned her closely interrogated other individuals in the house, and extended his investigations to a neighbouring woman Only after all this was done was I consulted by the police officer and asked to make a statement The effect of these investigations in the district was electric A woman was in labour, a strange doctor attended her the baby died for some mysterious reason, and here was a policeman! Anyone practising in poorer-class districts will appreciate how wide and wild were the stories spread Being merely a locumtenent, to me the incident was annoying but not damaging But had I just begun a permanent practice in that community it would be difficult to exaggerate what the effect would have been of such tales as were spread That the case went no further made it worse in a sense Had there been a coroner's inquest I would have been given the opportunity of redeeming by a public statement what reputation I had left As it is I may for ever be in certain homes an infanticidal maniac whose gory deeds will frighten little children into eating their spinach for years to come That spinach is good for little children is small comfort

It is one of the fundamental points in the administration of British justice that the coroner should have wide powers But the exercise of official latitude ought not to allow a coroner to conduct his investigations in such a way as needlessly to defame a medical practitioner Cases such as that reported by Dr Cullum ought not to be allowed to evaporate in ink Each and every similar instance ought to be made the subject of energetic protest by the British Medical Association Perhaps by such a process of education the few coroners who do not temper autocracy with consideration may be curbed—I am etc.

Antwerp Oct 24 ALAN KLASS

Indications for Induction of Abortion

SIR—The further letter by Dr Percy Hardy (*Journal* November 6, p 940) seems to answer itself the question as to whether the strictly medical problem is or is not the prime consideration in the measure he proposes If it is, why not have, as in other difficult medical problems, a consultant to advise? The indirect medical effects on mother and child in the vague, indefinite, non specific grounds envisaged are so all embracing as to include the problem of the unwanted child, etc The plea as to the effects on mother and child in such a case might be urged as strongly by sympathetic doctors in the environment of the patient

Nothing is more fundamental in the common law of England than the sacredness of human life and the punishment of the deliberate taking of it The suggested legal enactment would empower doctors—if three or more agree—to do what is admittedly illegal for one to do as being contrary to the general principle just mentioned Is this not an attempt to place doctors above the basic principles of English law, making them judges in their own case, even if law makers should attempt to legalize an illegality hitherto recognized as such morally as well as in civil law? Why should we attempt to do so, and again use the argument of "hard cases" for the making of bad laws? No law can make immorality moral even if it makes it legal—I am, etc,

London S W 1 Nov 6 REDMOND ROCHE

Local Treatment of Coryza

SIR—I was very interested in Dr Orley's letter on the local treatment of coryza For several years I have practised this treatment both in hospital and in private practice, and found it very efficacious I vary the oily mixture from time to time A very useful one is paraffin liq 3 parts paraffin molle 1 part menthol, 1/2 grain to 1 oz of mixture This is more viscid than the usual proprietary preparations

The method used is as follows With the patient in the recumbent position a pipetteful of the mixture is introduced into each nostril so that it may be felt at the back of the nose This is carried out twice daily at the beginning of a cold but four hourly once the cold is established and should be continued until all symptoms of coryza have abated I have seen severe colds cured in a day or two by this method Spraying the oil is useless it is essential to give massive doses I quite agree that the use of preparations containing ephedrine is harmful in these cases—I am etc

A Copper Salt for Treatment of Burns

SIR—It is gratifying to record an instance of burns of the third and fourth degree which have responded to an unusual extent to a novel therapy

The case was that of injury from boiling water to the lateral crural area from the knee to and including the anterior pedal aspect At the periphery of trauma large bullae were intermingled with folds of necrotic epithelium In the middle longitudinal or fibular axis the cutis vera was destroyed Treatment was begun in hospital soon after occurrence The bullae were incised and necrosed skin removed A thin layer of copper guaiacol sulphonate with acriflavine was applied and covered with sterile strips of gamgee The patient who had shown much fortitude declared her pain relieved and was dis

Vapo-Cresolene

Est. 1879

Vapo-Cresolene, specially prepared from creosoles of coal tar, soothes and relieves asthma, whooping cough, bronchitis, spasmodic croup, chest colds and throat catarrhs Laboratory tests by a research laboratory of unquestioned standing, show that the vapours produced from Vapo-Cresolene by the Cresolene Vaporiser exert a direct germicidal action when in contact with moist surfaces harbouring pathogenic bacteria associated with respiratory affections Sedative anti-spasmodic and penetrating, Vapo-Cresolene may be used to maximum advantage while the patient sleeps Vapo-Cresolene has enjoyed its reputation as a dependable inhalant for over 57 years and s invaluable for the treatment of children

was only to be worked by registered dentists The effect of that legislation on Dr Bynoe was very unfortunate, as he could not practise on members of approved societies

There was no ground for suggesting that any of the Dental Benefit Regulations were *ultra vires* Lord Justice Romer agreed, and Lord Justice MacKinnon added that counsel (presumably before the court below) had given no reason why persons entitled to practise dentistry on private patients should be excluded from the definition in the regulations

The result is undeservedly hard on Dr Bynoe The number of doctors practising dentistry in virtue of their medical qualifications may not be large, but there seems no reason why, if they can practise on one class of patient, they should be excluded from practising on another The exclusion from the dental benefit scheme is probably merely a draftsman's oversight The Statute Book contains many similar omissions, some of which have a much wider importance For instance, the new Arbitration Act, by the omission of a word excluded from jurisdiction in arbitration proceedings all the Masters of the Supreme Court, and also omitted to compel arbitrators to make their awards in writing The first of these difficulties has been overcome by administrative action, the second has not It ought not to be difficult for the Minister of Health to add suitable words to Regulation 21 to bring medical practitioners within the definition of dentist

ALLEGED NEGLIGENCE BY A CHIROPODIST

A diamond broker who had been up all night playing cards went to the Regent Palace Hotel to be shaved While he was in the chair he took off his shoe and told the barber that his foot had swollen The man advised him to see Mr Emlyn Jones the chiropodist of the hotel who attended to his foot while he was being shaved After the treatment he suffered from a blister on his foot which obliged him to stay in bed for three weeks He accordingly sued the managers of the hotel for the negligence of their chiropodist

At the hearing before Mr Justice Greaves Lord on October 28 and 29 (for a report of which we are indebted to the *Times*) the patient said that before treatment his foot was swollen but not painful During the treatment he had fallen asleep and he had been awakened by the burning heat of a lamp at his foot which looked like a piece of red meat. The swelling had increased and some hours afterwards he had discovered that it was blistered He had complained to the hotel two days afterwards but had not informed the manager and had not consulted his solicitors until several weeks later He admitted having suffered previously from gout

Dr W H Greatorex who had attended the patient gave evidence that the left foot had been blistered on top of the arch and that there had been a faint brown stain round the injury Some irritant seemed to have been applied iodine followed by damp heat might have caused the blister The treatment described—by iodine massage and a lamp—would be of no use for a swollen foot He added that the skin of some persons was blistered by even the weakest solution of iodine but he did not think the patient was unduly susceptible He agreed that none of the treatment which the patient had described could have caused the injury to his foot Fish poisoning could have caused the serum rash which he had also found

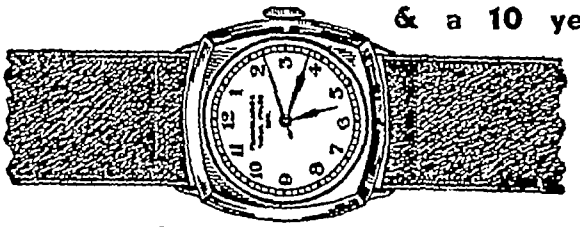
The chiropodist said he had had sixteen years experience and had treated this patient before He had advised him on this occasion to go to a medical man He had applied warm towels and soothing cream smeared a 2½ per cent solution of iodine on to the cream and applied a 32 candle power diffusing lamp for a minute and a half at twelve inches distance following this by eau-de-cologne a cold towel and boracic powder He admitted that the whole treatment was more of a show than anything else but thought that it could not possibly have done any harm as the iodine had not come into contact with the foot at all but only with the cream Dr Julius Burnford said that nothing in the treatment could be dangerous and the lamp was merely eye-wash He thought the plaintiff had a constitutional disturbance which might have been gout.

His Lordship in giving judgement said that he was satisfied that Mr Jones had used no harmful materials The lamp was merely part of the machinery of charlatanry used by some chiropodists to satisfy the vanity of certain human beings He dismissed the action with costs

AN ACTION DISMISSED WITH COSTS

A Mr Ephraim Burford who described himself as an optician failed recently to obtain damages from the proprietors of *John Bull* for an article which he complained was a libel on him The article was headed Two Quacks with Degrees and stated that Burford and a man known as Harry Browne had opened a campaign in Dorking that neither of this precious pair' was qualified to give treatment and that the degrees used by Burford— F Q O P" and "P N O S —had been described by a stipendiary magistrate as absolutely worthless Burford giving evidence, said that until 1927 his name had been Binderman He had tested eyes and supplied spectacles since the age of 16 He had studied optics at Northampton Polytechnic Institute and had passed certain examinations there and also two of the examinations prescribed by the Spectacle Makers Company but not all the final examination F Q O P meant Fellow of the Qualified Optical Practitioners' Association and F I B O meant Fellow of the Institute of British Optometrists Mr Harry Browne was a younger brother of his and had never been a partner If he found any abnormality he always referred the customer to an ophthalmic surgeon He had never been before a stipendiary magistrate His advertisements had been honest and had contained genuine testimonials He admitted describing himself as an eminent London eyesight specialist, but said that many tradesmen did similar things Testing eyes he described as a mere routine operation which a lad of 16 could do after three weeks instruction He denied that the examination for the degree F Q O P was farcical and could not remember the fee which was charged for the designation F I B O

Mr S G Tibbles said that Mr Burford had sent him patients with suggested diagnoses of their ailments He did not agree that a boy of 16 could learn to test eyes in three weeks The degrees in question did not amount to much the examination papers and the answers were totally inadequate Miss D H Porter secretary to an optician giving evidence for the defence said she knew nothing about optics but on payment of a subscription of half a guinea had been made a fellow of the British Qualified Optical Practitioners Association Mr J A Newrick secretary of the Ophthalmic Benefit Approved Committee said that his committee did not approve the examinations of that Association



The jury then stopped the case and the Lord Chief Justice dismissed the action with costs He added that it was to be hoped that the scheme to establish a register of qualified opticians and to tighten up the law relating to optical practice would be successful He would also be glad to think that this sort of enterprise was receiving the attention of those who administered the law relating to the obtaining of money by false pretences

The result of this action is to prove amply that Burford comes within the Oxford Dictionary's definition of a quack an ignorant pretender to medical or surgical skill

The governors of the Royal National Hospital for Rheumatic Diseases Bath have unanimously decided to accept the generous offer of the Bath Corporation to exchange sites and to build a new hospital Steps for preparing and raising the new site are now being undertaken

Medical Notes in Parliament

Dr Elliot presented the Housing (Agricultural Population) (Scotland) Bill on November 3, and it was read a first time Its chief purpose is promotion of provision of new housing accommodation to replace accommodation which is occupied by members of the agricultural population and is unfit for human habitation or is overcrowded It further proposes to amend the Housing (Scotland) Acts 1925 to 1935, relating to insanitary dwelling houses the provision of water closets and the making of by laws as to accommodation for seasonal workers The second reading of the Bill was moved by Dr Elliot on November 9 This was carried by 178 to 109

During the debate on the second reading of the Cinematograph Films Bill, on November 4 Sir Ernest Graham Little said as an example of a scientific subject depicted by a film a member of the staff of St Bartholomew s Hospital was able to produce a film to demonstrate the actual progress of inflammation which was of great advantage in assisting the understanding of an intricate and obscure process Instances of this kind might be multiplied indefinitely, yet there was no provision in this Bill for promoting the activities of the film industry in that direction The Bill was read a second time

The Expiring Laws Continuance Bill was read a second time by the House of Commons on November 4 and and passed through committee on November 8

The second reading of the Population (Statistics) Bill set down for November 8 in the Commons was postponed

The Parliamentary Medical Committee met at the House of Commons on November 8 Sir Francis Fremantle presiding and discussed the medical aspects of forthcoming Bills No changes were made in the office bearers of the committee for the session The committee will meet on the first Thursday of each month and Lord Horder will probably address it early in 1938 on the work of the Empire Rheumatism Campaign

Mr Tinker on November 9 secured a first reading for the Public Health (Coal Mine Refuse) Bill

The National Health Insurance (Juvenile Contributors) Bill and the Blind Persons Bill were down for second reading in the House of Commons on November 11

Nursing Scottish Committee of Inquiry

On November 2 Mr ELLIOT informed Mr Leonard that two members of the committee of inquiry into the recruitment for and conditions of the nursing profession—Miss Smaill superintendent of nurses at Edinburgh Royal Infirmary and Miss White the matron of Robroyston Hospital Glasgow—had nursing qualifications Before the appointment of the committee he invited the members of the Scottish committee which inquired into the training and registration of nurses in 1935 to extend the scope of their investigations to cover questions of recruitment and conditions of service The only new member of the committee was Lord Alness

Interdepartmental Committee on Nursing

The terms of reference of this committee are

"To inquire into the arrangements at present in operation with regard to the recruitment training, registration and terms and conditions of service of persons engaged in nursing the sick and to report whether any changes in those arrangements or any other measures are expedient for the purpose of maintaining an adequate service both for institutional and for domiciliary nursing

Sir KINGSLEY WOOD announced on November 4 that the Earl of Athlone had consented to act as chairman He has also stated that the terms of reference covered both general and mental hospitals and that the committee would inquire into the grievance of nurses who paid superannuation contributions but could not reclaim them

Abyssinian Refugees in Kenya

Mr ORMSBY GORE stated on November 3 that there were in Kenya about 6 000 Abyssinian refugees including many women and children Many were sick and there were 155 cases of small pox Other diseases were also prevalent though fatal cases were few It therefore became necessary to improvise arrangements for supplying them with medical attention and for their segregation from the native population of the Colony Supplies of vaccine were dispatched by aeroplane from Nairobi vaccination was carried out and other assistance rendered by all the medical staff available Mr Gore praised the splendid work the medical authorities had performed under conditions of great stress in supervising the health of the refugees He added that the refugees could not be accommodated in Kenya where it would be impossible for them to maintain themselves

Post-mortem Examination in Silicosis Cases

On November 4 Mr Hopkin asked if Sir Samuel Hoare knew that post mortem examinations were made in cases in which the patient had already been certified as suffering from silicosis and of the profound resentment at such a procedure by relatives of the deceased and his fellow workmen Sir SAMUEL HOARE answered that he appreciated the considerations to which Mr Hopkin referred but the difficulty was that men suffering from silicosis frequently died from other causes In many such cases it was not possible without a post mortem examination to determine the cause of death

Brown versus White Bread

Sir Kingsley Wood will ask the Advisory Committee attached to his Department to deal with the question of the different nutritional values of whole meal bread brown bread and white bread either in their next general report or otherwise He will publish any report by the committee on this subject

Prophit Trust Tuberculosis Research

Mr WM LEACH asked on November 8 whether the machinery of the Civil Service was being used on behalf of the Prophit Trust letters being sent officially to the staff at the money order office asking them to volunteer to undergo an examination consisting of an x ray photograph of the chest and a skin test whether this skin test would be either the von Pirquet or the Mantoux tuberculin test whether he was aware that there was a considerable difference of opinion in medical circles as to the significance of skin tests in tuberculosis and that the injection of tuberculin into the skin had occasioned a violent reaction in susceptible individuals and whether the Postmaster General would stop this exploitation of young civil servants

Major TRYON replied that the Royal College of Physicians was carrying out on behalf of the Prophit Trust a large scale research with a view to the early detection and prevention of tuberculosis in young adults With the previously obtained concurrence of the Staff Associations concerned it had been allowed to ask for volunteers among the Post Office staff including the staff at the money order department The whole scheme was on an entirely voluntary basis with no element of compulsion whatever The Mantoux test was used The efficacy of this test was the subject of investigation No danger was involved and the voluntary co-operation in this matter of young civil servants among others might be the means of practical assistance in the campaign against pulmonary tuberculosis Mr LEACH asked whose would be the

In our advertisement columns this week the University of Capetown invites applications for the Chair of the Practice of Medicine at a salary of £1 250 p a

The annual meeting of the Herefordshire Medical Society will be held at 1A, St John Street Hereford on Thursday November 18 at 4 15 p m After the business meeting Sir Thomas Dunhill will give an address on Diaphragmatic Hernia and Pharyngeal Pouches At 7 30 p.m the annual dinner of the society will be held at the Green Dragon Hotel Hereford

Two years ago Lord Nuffield gave £86 500 to trustees for the development throughout England and Wales of an organized plan of early discovery and orthopaedic treatment of children and others who were in danger of becoming crippled by deformity disease or injury This donation was specially intended to help districts possessing little or no orthopaedic organization The trustees working through the Central Council for the Care of Cripples have made grants towards the building of orthopaedic hospitals where they are most urgently needed, and have been instrumental in the formation of many new associations and Lord Nuffield has now given them a further sum of £150 000 to widen and intensify the scope of their work Of this new gift he has allocated £70 000 to Scotland and £26 000 to Northern Ireland and it is his wish that honoraria should be granted to help young surgeons to specialize in orthopaedic surgery

Mr A Chester Beatty has bought the former Freemasons Hospital in the Fulham Road London with the intention of presenting the building to rehouse the adjacent Research Institute of the Royal Cancer Hospital Mr Beatty will also equip the building and will re-equip the radiotherapeutic department of the Royal Cancer Hospital with the most modern high voltage x ray therapy apparatus

The trustees of a fund raised to commemorate the work of the late Sir William Simpson have through Mrs Alec-Tweedie offered the London School of Hygiene and Tropical Medicine a sum of money which will provide for the annual presentation of a Simpson Prize This will consist of books to the value of £3 10s and will be awarded annually to the student who obtains the highest marks in Part I of the January examination for the Diploma in Tropical Medicine and Hygiene

All work on the new nurses home of Westminster Hospital will be finished in time for the nurses to occupy the building by Christmas Queen Mary has consented to open the home in February Work on the new Medical School will be completed by January 1 This will enable the hospital to give possession of the old school premises and site in Caxton Street on that date to the purchasers of this freehold property which has been sold for £34 000

The committee appointed under the auspices of the Swedish Government to investigate the problems arising out of compulsory vaccination against small pox has now issued its report Exemption from vaccination is recommended in the case of conscientious objectors and their children but the committee considers that vaccination should continue to be compulsory for the armed forces of the Crown and for all civilians in times of epidemics

The Plymouth City Council has approved a scheme for reconstruction of the Plymouth City Hospital at a cost of £250 000 The new hospital will provide accommodation for only three more patients than at present but the existing building is regarded as wholly unsuitable for modern requirements

The Cesare Lombroso prize for criminal anthropology has been awarded to Dr Luigi Vervaeck director of the service of criminal anthropology in Belgium

Owing to its increase in size the *Chinese Medical Journal* will henceforth appear in two volumes a year

Professor Austregesilo of Rio de Janeiro and Dr Le Sage of Montreal have been elected foreign correspondents of the Academie de Medecine

QUERIES AND ANSWERS

Incontinence of Faeces

"A M" would be grateful for suggestions for the treatment of a girl aged 18 who during sleep passes faeces in her bed This happens every night. She has no knowledge of her distressing habit until she wakes up in the morning and finds her bed in a mess The girl is healthy in other respects and she is not a mental defective

Nocturnal Twitching of Lower Limbs

E B writes in reply to "Wilts" (October 30 p 888) Being subject to rheumatism I dosed myself with aspirin to such an extent that I set up a dyspepsia which recurs at intervals and is accompanied by twitching of the limbs when I get warmed up in bed at night If I take a dose of bismuth at bedtime I have no twitching but if I neglect to take this dose and the "fidgets" appear a dose of bismuth will still quieten things down usually in a very short time I have concluded that the trouble is not rheumatic but due to some nervous irritability originating in the stomach Wilts should try his patient with a dose of bismuth of magnesia just before getting into bed

Income Tax

Life Assurance Allowance

STANDARD" asks whether the maximum amount of the allowance is one sixth of the total or one-sixth of the taxable income as the inspector contends

"The expression used in Section 32 of the Income Tax Act is *total income* which is defined in Section 38 (2) of the Finance Act 1927 as the total income of that person estimated in accordance with the provisions of the Income Tax Acts In effect the total income is the aggregate of the items from various sources calculated according to the amount on which tax is payable less the amount from which the person in question is entitled to deduct tax such as annuities payments of interest on mortgage etc "Taxable income was the phrase used in Section 11 of the Finance Act 1930 but that section was repealed in 1931

Voluntary Allowance out of Colonial Income

"ENQUIRER has investments in India and South Africa Part of the income therefrom is remitted to this country and part is paid in South Africa to his wife mother as a voluntary allowance Is he entitled to exclude the latter portion in making his return for income tax"

We assume that "Enquirer" is resident in and domiciled in this country [illegible] of income from such

treated with serum depended on the day of admission of hospital. This system was extended to cases of bronchopneumonia as well as to those of croupous pneumonia and the serum was injected in some cases even when cutaneous or conjunctival tests had shown no abnormal sensitivity. Burroughs Wellcome Type I pneumococcal serum only was used as Type I infections are the most common. The dose on the day of admission was 20,000 units of 1st to 15th day inclusive 10,000 units. The corresponding doses for children under 10 were 20,000 and 10,000 units respectively. Between September 1st 1936 and March 31st 1937 156 cases of pneumonia were admitted to hospital of which sixty six were suffering from croupous pneumonia and ninety from bronchopneumonia. In these 91 cases Type I pneumococci were found. In the remaining cases the types most commonly found were III IV and VII. The authors compare the tables and graphs of the mortality among Type I infections treated with and without the serum treatment. Even when the infections caused by pneumococci belonged to some type other than Type I there was much lower in the serum treated cases than in the controls. In a long footnote to this paper D. T. Stevenson director of the State Serum Institute in Cape Town discusses the comparative merits of the rapid Felton method and the Institute's plans for providing Dominion residents with an adequate supply of pneumococcus I serum.

390 **Migraine**

A Series (*Wien. klin. Woch.* Aug. 20 1937 p. 1005) reports the results of treating seven cases of migraine with magnesium sulphate. A concentrated twice isotonic solution of magnesium sulphate was given. The first dose consisted of 2 ccm. of 1 per cent. solution and this was raised to 5 ccm. The injection was given very slowly preferably with the patient lying on his back. Out of the seven cases treated forty five attacks showed relief four cases were cured altogether while the remaining twenty five were unaffected. The treatment proved harmless and was well tolerated in every case.

Ophthalmology

391 **Seborrhoeic Blepharo-conjunctivitis**

W. B. Clapp (*Amer. J. Ophthal.* August 1937 p. 803) believes that most cases of chronic inflammation of the eyelids are due to a seborrhoeic blepharo-conjunctivitis. It starts in the sebaceous glands of the eyelid and in the Meibomian glands. Permanent cure cannot be obtained without the elimination of the associated seborrhoea which usually is found elsewhere. The affected cilia should be epilated the Meibomian glands expressed the conjunctival sac irrigated the lid margins rubbed with a mild antiseptic lotion and a sulphonamide ointment should be applied daily. Adrenaline drops assist in reducing the congestion of the conjunctiva. If the ulcerative stage has been reached the rubbing should be delayed until the ulcers have healed. The refraction should be determined optic foci eliminated and the associated seborrhoea treated. The condition must be distinguished from blepharitis marginalis.

392 **Intraocular Foreign Bodies**

P. Barbat (*Arch. Ophthal.* Paris July 1937 p. 605) in order to determine the position of foreign bodies anæsthetizes the eye and injects 1/10 ccm. of warm liquefied lipiodol at the limbus at 12 and at 6 o'clock the vertical diameter of the cornea being measured. After half an hour or more the eye is x-rayed with the eyes bandaged. A frontal view is taken the film being adjusted by initial screening so that the two opaque areas have a maximum separation. A lateral view is then taken with the film nearest to the injured eye and the tube centred on the film. A tracing of the shadows of the lipiodol and of the foreign body is made. These x-ray plates are screened [illegible] the centre of the lipiodol shadow and a thread [illegible] the foreign body's image. [illegible] the [illegible] the [illegible] the

HIS MAJESTY'S COLONIAL SERVICE

COLONIAL MEDICAL SERVICE.

It is anticipated that not less than 10 vacancies for Medical Officers will occur before the end of 1937 The majority of these will occur in Tropical Africa and in Malaya

QUALIFICATIONS—Candidates must be British subjects of European parentage, under 35 years of age, and must possess a medical qualification registrable in the United Kingdom Preference will be given to candidates who have held Hospital or Public Health appointments or who have special knowledge of anaesthetics, radiology, surgery, medicine, ophthalmology, gynaecology and midwifery diseases of the ear, nose and throat, venereal diseases, etc

SALARY—Initial salaries vary from £600 to £700, and rise by increments to a maximum of between £1,000 and £1,200

PRIVATE PRACTICE—Private practice is not allowed as of right, but in the case of some appointments it is permitted on certain conditions

QUARTERS—In Tropical Africa, free quarters, or an allowance in lieu, are provided In Malaya, quarters are provided at an annual rental not exceeding 6% of an officer s salary

PASSAGES—Free first-class passages are provided on first appointment and when returning from leave. Assistance is also given towards family passages

TERMS OF APPOINTMENT.—The appointments are pensionable, subject to a probationary period which varies from two to three years

COURSES OF INSTRUCTION IN TROPICAL MEDICINE AND HYGIENE—Selected candidates will normally be required to attend a course of instruction leading to the Diploma in Tropical Medicine and Hygiene before proceeding overseas

DUTIES—Although Medical Officers are appointed in the first instance for general service, there are opportunities for work in special branches of medicine and surgery, in public health, and in medical research

Further particulars and forms of application may be obtained from the **Director of Recruitment (Colonial Service), 2, Richmond Terrace, Whitehall, London, S W 1**

ROYAL NAVAL MEDICAL SERVICE.

Vacancies exist for Medical Officers in the Royal Navy, and applications are invited for entry in January, 1938

Candidates below the age of 28 years are preferred, and they must be registered under the Medical Acts No examination in professional subjects will be held, but candidates will be required to attend for interview by a Selection Board

Selected candidates will be entered for Service for a period of three years in the first instance, which may be extended to five years at the discretion of the Admiralty

At the end of three years' service officers may retire with a gratuity of £400, but those who serve for five years will receive £1,000

At the end of five years' Short Service permanent commissions will be given to selected officers who wish to make the Naval Medical Service their permanent career Officers transferred to the permanent list will receive a gratuity of £1,000 (less Income Tax)

Opportunities are available for officers on the permanent list to specialise, and ample provision is made for Post-Graduate study

Copies of the regulations for entry and conditions of service, including rates of pay and allowances, may be obtained from the Medical Director-General of the Navy, Admiralty, S W 1, and from the Deans of all Medical Schools

Applications for entry from intending candidates must be received not later than November 22nd, 1937.

To the man with a sense of balance

We warn you—your first pipeful of this tobacco is *not* going to be a thrill WILLS's Cut Golden Bar has *no* super-subtle flavour In fact, you may even decide that there is nothing very remarkable about it. In a way, you ll be right if you do For this tobacco is purposely blended so as to avoid striking characteristics In both flavour and aroma, we have aimed at getting a perfectly natural balance. It is, indeed, this very absence of "mannerisms" that has made it so amazingly popular — as the regular smoker's regular 1/- tobacco *You can get it in the Original form or Ready Rubbed*

WARM, DRY BEDS FOR OPERATION AND ACCIDENT CASES

In cases of sudden emergency and for everyday use, the Thermega Electrically Heated Blanket is invaluable for providing warm damp-free beds. Hospitals and Nursing Homes throughout the country use Thermega. It is the one proven remedy for driving out dampness and ensuring warm beds at the turn of a switch.

The "Thermega" Electric Pad for local application is ideal for relief of pain

At all good stores chemists, electricians, or from Thermega Limited 51/53 Victoria Street London, S.W 1

'Thermega' Electrically Heated BLANKETS & PADS

Blankets from 3 gns *Pads from* 31/6. 3-*Temperature Blankets for medical use* £8 10s Single-heat Blanket specially strengthened, from £4 4s. Various sizes and prices on application

Insist on "Thermega" It is vital that these appliances should be made by experienced manufacturers.

THE ABSOLUTE COMFORT and security which the Deimel Underwear affords in the most trying climate is remarked upon by all its wearers Those whose powers of resistance have been weakened by wearing unsuitable underwear derive new strength from Deimel Mesh Garments which absorb and eliminate perspiration quickly, and provide a dry climate about the body which enables the wearer to undergo extremes of heat and cold with comfort.

INDIAN MEDICAL SERVICE

RECRUITMENT OF EUROPEAN OFFICERS

Applications are invited from Medical Men for Permanent Commissions in His Majesty's Indian Medical Service The terms offered include a gratuity of £1,000 on retirement after six years' service or of £2,500 after 12 years service, together with free return passages, for those who no longer desire to remain in the Service In other respects the terms will be as detailed below

British subjects of pure European descent who are under 32 years of age and who are registered under the Medical Acts in force in Great Britain and Northern Ireland are eligible to apply

CAREERS

The Indian Medical Service offers a permanent career with wide opportunities of medical experience including clinical preventive specialist and research work At the beginning of his career an officer is employed on the military side which has medical charge of the Indian Army Promotion is on a time scale up to the rank of Lieutenant Colonel and by selection to the ranks of Colonel and Major General An officer may apply after one year's Indian Service to have his name registered for transfer to the civil side from which appointments are made to Civil Surgeoncies, which are established at the principal civil centres to provide for the medical needs of Civil Officials and for general medical administrative purposes to specialist (for example public health and bacteriological) services to research posts and to professorships at the Medical Schools

'Elastoplast' and Post-Operative Dressings (Abdominal)

'Elastoplast has proved itself to be invaluable when used in conjunction with the usual sterile dressing It facilitates inspection and it is a simple matter to change the dressing by following one of the methods in daily use which are described in "Elastoplast Technique."

As soon as an abdominal wound is healed I allow the patient to go home with gauze over the wound and this is kept on by transverse pieces of 'Elastoplast' and no bandage" F R.C.S

"For retention of dressings after operation the 'Elastoplast' prevents slipping of dressings and provides a firm pressure for wounds, thus preventing post operative collection of blood or serum in the wound' M S, F R C S

A copy of 'Elastoplast Technique" will be sent on request.

ROYAL NORTHERN INFIRMARY
Inverness

APPOINTMENT OF MEDICAL CONSULTANT AND HON. CHARGE PHYSICIAN

The Directors invite applications for the new post of Medical Consultant and Hon. Charge Physician at the Royal Northern Infirmary, Inverness.

Candidates should preferably be Fellows of the Royal College of Physicians of Edinburgh or London and must be graduates of a British University.

The successful candidate will be in charge of at least twenty beds in the Infirmary and in addition he will be required to act as Medical Consultant in the Northern Area under arrangements with the Department of Health for Scotland and the local authorities concerned.

Payments in respect of salary for the above services will be at the rate of £1,200 per annum and will be subject to revision within five years.

The person appointed will be free to undertake other consultant work throughout the Northern Area but must not engage in general practice or in the practice of obstetrics or surgery.

Further particulars may be obtained from Robert Gilbert, Esq., Honorary Secretary, Royal Northern Infirmary, Inverness, with whom applications for the post together with twelve copies of testimonials must be lodged not later than December 10th, 1937.

ADDENBROOKE'S HOSPITAL, CAMBRIDGE.

Applications are invited for the post of RESIDENT ANAESTHETIST AND EMERGENCY OFFICER (male). The appointment will be for three months from January 1st, 1938. Salary at the rate of £130 per annum with board, residence and laundry. Candidates, who must be unmarried and duly registered, are requested to forward their applications, stating age, qualifications, etc., together with copies of not more than four recent testimonials to the undersigned on or before Wednesday, November 17th, 1937.

J. A. BEARDSALL,
Secretary-Superintendent.

VICTORIA HOSPITAL, BLACKPOOL
(182 Beds.)

APPOINTMENT OF PATHOLOGIST

The Board of Management invites applications from duly registered medical practitioners who have had adequate training in a department of high standing for the appointment of a full-time Pathologist to take charge of a new department about to be established and which will commence to operate on January 1st, 1938.

The work will include Pathology, Clinical Pathology and Bacteriology undertaken for the patients of the Hospital and also the examination of materials sent from external sources. Private practice will not be allowed.

Salary at the rate of £350 per annum together with the first £250 per annum of the gross receipts and fifty per cent. of the further gross receipts until these reach a total of £1,850 per annum. Thereafter further advances will be at the discretion of the Board.

The prospects of the rapid development of the private income of the Department are considered particularly good.

Applications together with copies of recent testimonials should be sent to me not later than November 30th, 1937.

WALTER R. SMITH
General Superintendent.

CHESTERFIELD AND NORTH DERBYSHIRE ROYAL HOSPITAL
(220 Surgical and Medical Beds.)

HOUSE SURGEON

Applications are invited from fully qualified men for the above post. The appointment is for six months. Salary at the rate of £150 per annum with board, apartments and laundry.

Applications stating age, together with copies of three recent testimonials should be sent to the undersigned as soon as possible.

M. H. BOONE,
Superintendent and Secretary.

October 28th, 1937.

NATIONAL SANATORIUM BENENDEN
Kent.

RESIDENT ASSISTANT MEDICAL OFFICER

The Council of the National Sanatorium Association invites applications for the post of Resident Assistant Medical Officer to commence on January 1st, 1938.

Candidates should have had previous experience in tuberculosis. The salary will be £350 per annum rising by £25 per annum to £425 with board, residence and laundry.

There are 150 beds at the Sanatorium.

Applications stating age, nationality, qualifications and previous experience, together with copies of three recent testimonials, to be sent to the undersigned not later than November 22nd, 1937.

C. C. LAWRENCE,
Hon. Secretary.

42, West Drive, Cheam, Surrey.

Envelopes should be marked PERSONAL.

Protect Mother and Infant with Argyrol

The best opinion of today is that antenatal treatment of all gravidae should include a thorough search for gonorrhoea, irrespective of social status

Where there is the slightest suspicion of gonorrhoea in one parent or both, protection is afforded by the use of vaginal tampons saturated in 25 per cent solution of Argyrol Brand Silver Vitellin—the standard in gonorrhoea

Argyrol has peculiarly sedative, inflammation allaying qualities, and its clinical successes of 30 years' duration may be easily accounted for by pertinent chemical facts

The very great differences between Argyrol and other silver salts in silver ion and in hydrogen ion concentration (or alkalinity) no doubt have much to do with the irritation noted by doctors when allegedly equivalent mild silver proteins are substituted The pH and pAg of Argyrol Brand Silver Vitellin are especially regulated for treatment of delicate mucous membranes

Premium 2 years' purchase.
17. LONDON, EAST.—Established 30 years and producing £1,400 p.a. approximately. Panel of about 1,500 and appointments worth about £...0 p.a., included in total gross cash receipts. Small house on rental at £60 p.a. Accommodation apart from surgery etc. consists of 1 sitting room and ... bedrooms. Premium 2 years' purchase.
18. ESSEX.—Well-established PRACTICE, producing for past ... months about £1,200 including a Panel of over 1,500 patients. Expenses are small. Fees 2/6 and visits 3/6. The Practice is stated to be increasing steadily. Good house containing surgery, waiting room and dispensary, 2 reception and 4 bedrooms, for disposal. Garage and garden. Price £...,000. Premium £1,000.
19. SURGICAL PARTNERSHIP in delightful district within easy reach of London.—A fifth partner is required in an old-established Practice. There is little surgical done under 10 guineas although the patients come from all classes. The partner will must build the Surgical business but would do all the surgery for the firm but must be prepared to do general practice as well. Chance for ...
20. CROYDON AREA.—Rapidly increasing PRACTICE producing about £1,000 p.a. Panel of about 1,100. Fees 1/6 to 3/. with visits from 2/6 to 5/. Practice is easily worked and offers good opportunity. Suitable house suitable on rental. Premium £1,200.
21. LONDON, S.E.—Old-established PRACTICE producing about £1,000 p.a. Receipts have declined owing to illness. Panel of ... patients. Large house with very good garden can be rented.
22. SUSSEX COUNTRY.—Good NUCLEUS with scope for further increase. Receipts 1935 £467, 1936, £628, 1937 for 7 months, £452. Panel produces about £267 included in above. Good house on rental.
23. HOME COUNTIES.—RESIDENTIAL TOWN.—PARTNERSHIP.—A one fourth share with increase later is for disposal (after a preliminary assistantship of 6 months if wished), in a particularly sound mixed-class Practice offering good surgical scope. Gross cash receipts for last 12 months stated to be approximately £4,800. Panel of about 2,000 and good appointments worth about £360 p.a. Visits 3/6 to 21/. Choice of houses. Ingoing partner must have the Fellowship, have had hospital surgical experience and be accustomed to better-class work, preferably married and not over 34 years of age.
24. HOME COUNTIES.—Mixed-class PRACTICE in residential district established many years. Average gross cash receipts for last 3 years £1,356 p.a. Panel of 750 and appointments worth over £100 p.a. Nice house with good garden containing 2 reception, 5 bedrooms, dressing room etc. Professional rooms with separate entrance can be rented at £95 p.a. Sport of all kinds and good educational facilities. Premium 2 years' purchase.
25. NORTH LONDON.—Middle and better-class PRACTICE suitable for medical man with qualified wife or for working with a lady assistant. Gross cash receipts for last 12 months £1,681. Panel of 320 appointments worth about £70 p.a. Visits 5/ to 7/6. Good house with reception, 5 bedrooms, etc. Professional rooms, small garden garage. Freehold for sale or might be rented. Premium 2 years' purchase or near offer.
26. OUTLYING EASTERN SUBURB.—Non-panel PRACTICE established upwards of 45 years and held by vendor for past 15 years. Gross cash receipts for last 12 months £2,236 p.a. Very moderate expenses. Very nice detached corner house with garden back and front, side entrance containing 2 reception, 6 bedrooms, etc. Price £1,000. Premium 2 years' purchase.
27. PARTNERSHIP.—LONDON, EAST.—A HALF SHARE of middle and working-class Practice producing for immediate past 12 months £4,567 p.a. Panel of over 5,000. Suitable house can be obtained.
28. NORTHERN SUBURB WITHIN 10 MILES OF HYDE PARK.—Middle class PRACTICE offering very good scope for increase producing for immediate past 12 months £829. Panel of about 560 and appointments worth £50 p.a., plus private fees. Good house containing 1 reception, 4 bedrooms, Professional rooms, good garden and garage. Price freehold £1,300 or can be rented at £90 p.a. Premium £1,200.
29. RESIDENTIAL TOWN WITHIN 35 MILES OF LONDON.—Old-established non-panel PRACTICE, producing over £2,800 p.a. Good house with 3 reception, 4 bedrooms, etc., good Professional rooms, garden, garage. Can be rented on lease at £63 p.a. Moderate expenses. Good educational and sporting facilities. Premium 1½ years' purchase.
30. NORTH EAST COAST.—Old-established PRACTICE, producing about £900 p.a., but stated to be capable of considerable increase. Choice of suitable houses. Partnership introduction will be given. Vendor retiring.
31. SOUTH WEST LONDON.—PRACTICE has been established over 40 years and has been held by vendor (who wishes to return abroad) about ten years. Gross cash receipts for last 12 months over £900 including Panel of about 350 which could be increased. Suitable house with 5 bedrooms on rental. Moderate premium for quick sale.
32. WEST MIDLANDS.—PLEASANT RESIDENTIAL TOWN.—PRACTICE producing about £1,600 p.a. including a selected Panel of about 560 patients. Mostly better-class and non-dispensing. Consultations 3/6 to 10/6. Visits 5/ to 1 guinea. Freehold house for disposal, contains 3 reception, 3 large and 3 smaller bedrooms with separate servant's quarters. Excellent consulting rooms, garage for 2 cars.
33. HAMPSHIRE NUCLEUS.—stated to be producing now at the rate of £5 per week and to offer considerable scope for an energetic worker.
34. LANCS.—High-class Seaside and Residential Town.—Easily worked old-established PRACTICE for sale. Gross cash receipts about £1,100 p.a., including a panel of about 325 patients. Fees 3/6 to 10/6. Visits 5/ to 21/. Midwifery about 12 cases p.a. Minimum 5 guineas rising to 15 guineas. Mostly non-dispensing. Low expenses. Suitable house available with consulting and waiting rooms, 2 reception, 3 bedrooms and a maid's room and box room. Large garden and garage. Leasehold for sale or would be rented. Premium 1½ years purchase. There is stated to be good scope for increase for an energetic man.
35. DEVON, SOUTH COAST.—A well-established good-class entirely private PRACTICE producing for the past 12 months about £1,000. Panel could be had if desired. Fees 2/6, 3/6 and 7/6 with a few visits up to £1. Non-dispensing. Suitable house containing consulting room, 2 reception rooms, 6 bedrooms, for sale. Freehold £1,400. Partnership introduction would be suitable for ex I.M.S. or similar.
36. DEVELOPING NORTHERN SUBURB.—A 3/8th SHARE is offered in a well-established and growing Practice. Receipts for 12 months to 1/4/37 amounted to about £5,300 including about £1,000 from appointments and a Panel of some 5,200 patients. There is a choice of houses available.
37. LONDON, E.—Long-up PRACTICE established 50 years for disposal. Income about £900-£900 p.a. with Panel of about 1,150 patients. Fees 2/6 and 3/6. Visits from 3/6. Suitable accommodation available consisting of consulting room, dispensary, waiting room, the remainder being sub-let for £...50 p.a. Rent and rates £...30 p.a. Premium 2 years' purchase to include about £1,000 fittings, fixtures, drugs, etc.
38. CITY PRACTICE.—Long up hours 10-1 and 5.30-6.30, producing about £1,000 p.a., including £200 from Panel and appointments. Suitable accommodation available.
39. LONDON, S.W.—Old-established PRACTICE producing £1,...00 p.a., with panel of 1,...6 patients for disposal. Appointments and small club bring in about £85 p.a. House available contains Professional accommodation, reception room and 3 bedrooms and maids room, bathroom. For sale or might be rented. Premium £1,000.

The Agency has made arrangements for special facilities, on very favourable terms, to be afforded to approved purchasers for the advance of part of the premium for any suitable practice or partnership. Full details on application.

Modern Iron Therapy

Iron 'Jelloids' are an elegant and reliable means of administering the proto-carbonate of iron The preparation has none of the disadvantages of Pil Blaud The iron content remains fresh and unoxidized indefinitely, and injury to the teeth is avoided

The 'Jelloids' are highly effective in the treatment of achlorhydric anaemia and indeed in all the simple anaemias in which massive iron therapy is indicated

Iron Jelloids

You are cordially invited to apply for samples for clinical test.
The Iron 'Jelloid' Co, Ltd, King George's Avenue, Watford, Herts.

In Pregnancy and Lactation

THE importance of regular and adequate bowel action is impressed on the patient during ante-natal supervision The question of how to ensure this can be confidently answered by prescribing "Cristolax" —the ideal combination of pure medicinal paraffin with "Wander" Dry Malt Extract

"Cristolax" is the laxative of choice during gestation its regular use assisting digestion and ensuring adequate bowel clearage without straining or other unpleasant effects A noteworthy feature is its pleasant non-oily taste which does not upset the unstable maternal digestion

The use of "Cristolax" can be prolonged with advantage throughout lactation Its gentle but efficient action ensures elimination of toxic material Unlike many cathartic drugs, "Cristolax" cannot adversely affect the milk, since its laxative component is not absorbed

Design from Greek Vase

FREEZING

for 16 hours

STARTED IN 7 SECONDS

For sixteen hours a complete car was shut up in a refrigerator with the temperature at minus one degree centigrade. At the end of this time the engine was as cold as it would be after a night in the coldest garage. Then the car was started with the normal equipment. The time taken with the new Double Shell Oil was seven seconds. This test was carried out with a brand new 1938 car because the clearances between bearings were less and the engine was naturally stiffer and harder to start than an older one would be. The new Shell Oil prevents dry starting because it is fortified with an exclusive oily compound which makes the oil clung to cylinder walls and bearings instead of draining off when the engine cool down. This protective film of oil prevents wear at the most critical time—when starting from cold. **No wonder Humber, Hillman and Talbot all use and recommend the new Shell oil exclusively.**

DOUBLE SHELL (medium) oil is officially approved by A.C. ARMSTRONG SIDDELEY AUSTIN BENTLEY B.S.A. CITROEN HUMBER HILLMAN M.G. MORRIS RILEY ROLLS ROYCE SINGER S.S. STANDARD SUNBEAM TALBOT WOLSELEY ETC.

NEW DOUBLE SHELL *(medium)* LUBRICATING OIL

MORE ENERGY FOOD IS STILL REQUIRED . . .

"In some countries, where the level of national income is low, improvement in the diet will take the form principally of *increased consumption of foods of high energy value.* In others, where average income is high, the stress will be more particularly on the protective foods

But, even in these countries, recent studies of consumption suggest that APPRECIABLE SECTIONS OF THE POPULATION ARE NOT AT PRESENT CONSUMING ENOUGH OF THE ENERGY-BEARING FOODS."

Final Report of the Mixed Committee of the League of Nations on Nutrition

BREAD *for* ENERGY

Practical Applications of the

KAYLENE-OL

Treatment

CHRONIC COLITIS

(Simple Mucous, Muco-Membranous, Post-Dysenteric)

(Kaylene Brand of Colloidal Kaolin with highly viscous liquid paraffin)

Alternating intervals of constipation and diarrhoea often occur in cases of colitis Kaylene ol is applicable in either phase Its soothing and adsorptive actions combat the irritative diarrhoea, and its softening and lubricating actions counteract constipation during the intervals

DOSE—KAYLENE-OL 1 or 2 dessertspoonsful three times a day, half hour before meals, or in mild cases half hour before breakfast and at bedtime

Kaylene-ol c Phenolphthalein (0 5 per cent) is taken when constipation is particularly troublesome Dosage as for Kaylene-ol

Campho Sulphonate of ephedrine	2 5 „
Extract of boldo	100 „
Extract of crataegus	200 „
Extract of salvia	100 „
Tincture of marrubium	100 „
Glycerine extract of thyroid (1 equals 1 of fresh gland)	0 10 „
Valerian	500 „
Hexamethylene tetramine	100 „
Excipient q.s	ad 1,000 c.c.

PRICE - 4/6 per 4 oz bottle.

Sample and Literature on request

Serenol is a sedative with action on the centres of the nervous vegetative system, sympathetic and parasympathetic, and on the cortical centres Recent knowledge has shown the interaction of nervous vegetative system and endocrine system, and on this knowledge SERENOL is based. It is thus a *biological*, not a *symptomatic*, sedative, and, unlike many other sedatives, has not a direct depressant action on the cortical cerebral centres

Serenol is indicated in conditions of anxiety and general irritability, insomnia, hyperthyroidism, hyperadrenalism (as in neurocirculatory asthenia, effort syndrome), the so-called *nervous palpitations of the heart*, etc.

Serenol is given in the following dosage For mild cases one to two dessertspoonsful on retiring For more severe cases one dessertspoonful at 10 a m , one dessertspoonful at 4 p m and two dessertspoonsful on retiring

Serenol, being a biological sedative containing no barbiturate, is not habit forming

CONTINENTAL LABORATORIES LTD **30 MARSHAM STREET, LONDON, S W 1**

Oral Vaccine for the prevention of Colds and Influenza

Since Genora brand Oral Vaccine was introduced to the Medical Profession last Winter, extensive clinical and laboratory tests have shown that it establishes a high degree of *immunity against colds and influenza* the oral vaccine has also proved successful in the treatment of chronic bronchitis and similar respiratory infections

This vaccine contains hæmolytic streptococci, in addition to other organisms incriminated in the causation of *coryza and influenzal infections* It has been found that the ingestion of the oral vaccine against colds and influenza also develops immunity to diseases caused by hæmolytic streptococci

Particulars concerning Genora brand Oral Vaccine will be found in the new brochure on Vaccine Therapy *which has recently* been published by Genatosan Ltd This booklet also gives information regarding a wide range of vaccines administered by hypodermic injection and the standard types of Local Immunity Products A copy of the *brochure* will gladly be supplied to any physician on request.

AN EPITOME OF CURRENT MEDICAL LITERATURE will be found at the end of the JOURNAL

After Influenza Pneumonia and other Acute Infections

The general action of 'Bynin' Amara is manifested by increased tone of the nervous, muscular and cardio-vascular systems It stimulates the digestive organs, improves the flagging appetite, corrects anæmia and aids nutrition generally

The marked asthenia and nervous depression which are prominent features of the post-influenzal state, yield rapidly to its influence A course whenever there is any indication of lowered resistance is a valuable safeguard against infection

In bottles at 2/-, 3/6, 6/6 and 12/-

Descriptive literature and clinical trial sample on application

'BYNIN' the effective tonic

AMARA

ALLEN & HANBURYS Ltd, London, E 2

'DETTOL' and Midwifery

The composition and properties of 'Dettol' make it a most suitable antiseptic for use in the conduct of labour Its properties enable it to be used in really effective strengths on the skin and mucous membranes It has been shown that when half a teaspoonful of 30% 'Dettol' is rubbed into the hands, allowed to dry and kept free from gross contamination, the skin remains insusceptible to infection by haemolytic streptococci for at least two hours

'Dettol' has high germicidal efficiency and this is well maintained in the presence of blood, serum, pus and other organic matter *'Dettol' is obtainable from chemists in 1/-, 1/9 and 3/- bottles, and in larger sizes for medical and hospital use These prices do not apply in the Irish Free State and Overseas Samples and full information on request*

Formula

Intestinal glands	0 05 grms.
Biliary extract	0 10 „
Lactic ferments	0 05 „
Agar-agar	0 05 „
Filler tablet	0 35 „

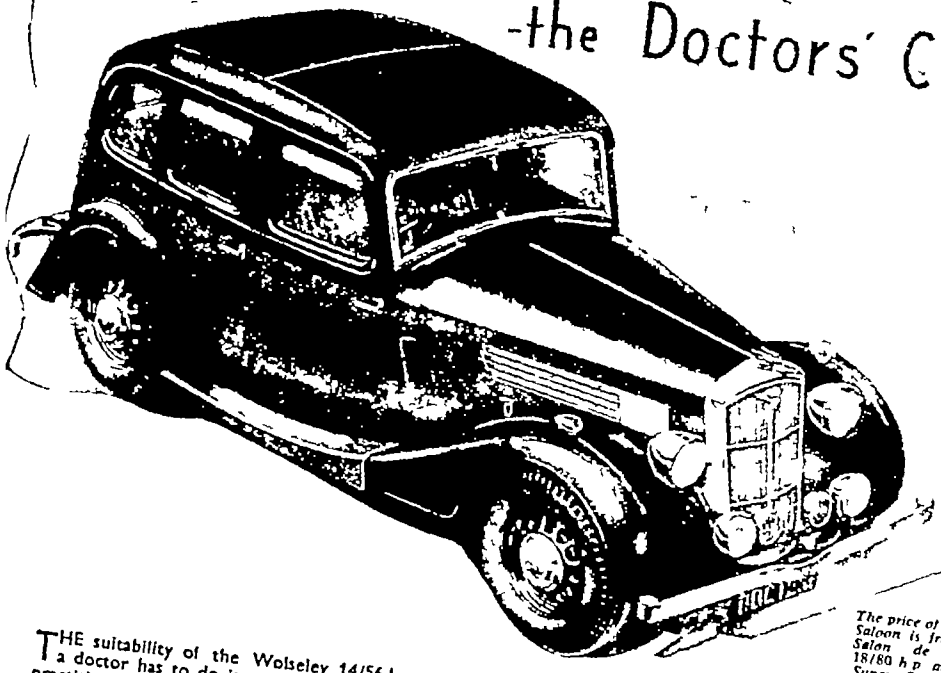
Initial Daily Dose
Two Tablets

Laxatives, it is well known nowadays must have two essential characteristics

1 They must be biological i e they must accord with and imitate in their action the natural physiological processes of the intestine

2 They must be capable of educating the intestine so that the habit of a laxative is not formed and the intestine can function unaided when bowel adjustment is attained

Taxol has both these advantages



Taxol has not the violent irritant action of many laxatives and purgatives, but stimulates the intestine by processes which resemble those of nature. The intestinal gland which is an important part of its composition acts on the intestine by reinforcing the deficient function which has culminated in constipation This stimulating action is gentle, and does not force the weakened intestine to efforts beyond its power, which would culminate in aggravation of the constipation

Taxol is not habit-forming It re-educates the intestine to resumption of normal function unaided thanks to the biological nature of its action It contains no irritant drug of violent and artificial action to which the intestine can become accustomed On the contrary, many stubborn cases of constipation, after a course of TAXOL, revert to normal and regular peristalsis.

CONTINENTAL LABORATORIES LTD  41, MARSHAM STREET, LONDON, S W 1

WOLSELEY 14/56 H.P.

-the Doctors' Car

THE suitability of the Wolseley 14/56 h p for the work a doctor has to do is so striking that large numbers of practitioners all over the country have chosen it above all others A doctor s work calls for —

EASY STARTING—In the Wolseley 14/56 h p a thermostatically controlled water system does away with warming up delays and sluggish pulling A 12 volt electric system and twin batteries ensure ample starting energy

ROOMINESS—Quick and easy exit through wide doors fresh air renewal every 60 seconds and anatomically correct seating mean lack of fatigue on even the longest day

NIGHTWORK—Powerful headlamps twin fog lamps stop and reversing lamps and duplex screen wipers lessen the strain of dark and rainy nights

ECONOMY—24 to 28 miles per gallon is good for a 14" Wolseley stabilised production policy lowers depreciation

QUIET—Body door and floor are completely insulated from noise—the interior from fumes

APPEARANCE—The Wolseley 14/56 either as a Saloon or in its Salon de Ville form is a distinguished handsome car—very indicative of the standing of its owner

The price of the 14/56 h p Saloon is from £760—the Salon de Ville £345 18/80 h p are from £380 Super Sixes from £390 and the 12/48 h p from £ 45

PROSEPTASINE
TRADE MARK
Recent publications confirm that PROSEPTASINE is fully AS ACTIVE AS and much LESS TOXIC than sulphanilamide It has the highest therapeutic ratio of any anti streptococcal agent yet produced

SOLUSEPTASINE
TRADE MARK
The colourless sulphonamide preparation for parenteral administration MAY BE INJECTED INTRAVENOUSLY For use in very urgent cases and where there is difficulty in swallowing or retaining medicine given by mouth

There is evidence to show that these drugs are effective in B Coli infections

A copy of a detailed publication on these two products—CHEMOTHERAPY OF STREPTOCOCCAL INFECTIONS—will be sent on request.

PHARMACEUTICAL SPECIALITIES
(MAY & BAKER) LTD DAGENHAM

Why the filter tip?

In every "du Maurier" cigarette you will find the filter tip It is a five-layer protection—three layers of pure white vegetable tissue alternating with two of cellulose fibre No irritant that might harm a sensitive throat can get through that. No stray "bits" can worry the throat. But there's no stopping the clean flavour of the finest Virginia tobacco

du MAURIER

the perfect cigarette with the exclusive filter tip

For Intestinal Stasis

VISCOSITY AND LUBRICATION THERAPY

One of the most important tests in connection with the preparation of mineral oil for therapy is that for viscosity

The viscosity of Nujol is physiologically correct at body temperature

When Nujol is prescribed the practitioner is protecting the patient by using the standardised intestinal lubricant

Lubrication therapy is preventive therapy Correct lubrication therapy implies Nujol therapy

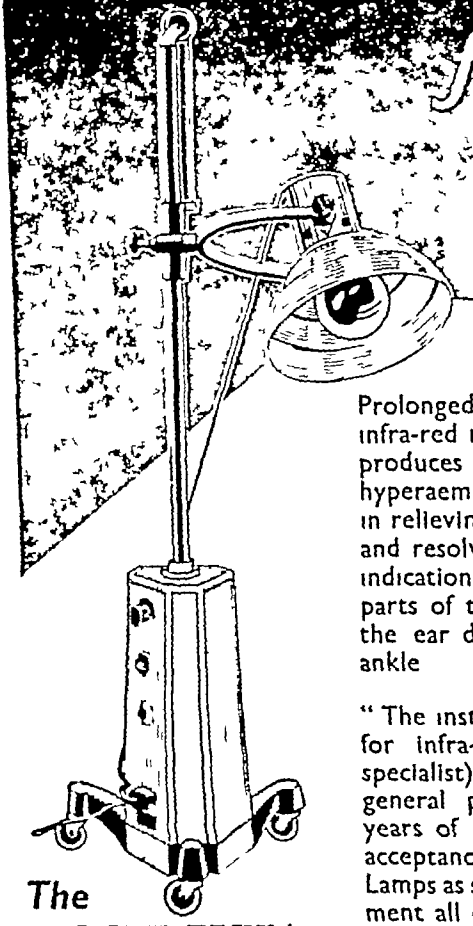
Nujol

costs the patient only

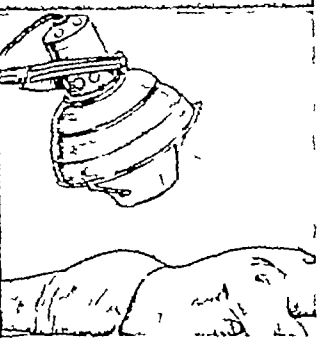
1/6 or 2/6

(8oz or 16oz bottles respectively)

CREAM OF NUJOL



Indicated in cases where a plain oil, however bland and tasteless—is not tolerated A delightful emulsion of Nujol free from sugar or medicaments Cream of Nujol contains only Nujol, emulsifying agents and flavouring 16 oz—3/6



Samples of Nujol and Cream of Nujol for clinical test obtainable from

STEMCO Ltd, Nujol Laboratories, 128 Albert Street, London, N W 1

for

INFRA-RED THERAPY

Prolonged irradiation with the infra-red rays of the Sollux Lamp produces a deep and lasting local hyperaemia with sovereign results in relieving pain, removing stasis, and resolving inflammation The indications include lesions in all parts of the body, from boils in the ear down to sprains of the ankle

"The installation of an apparatus for infra-red rays (writes one specialist) would well repay every general practitioner" Twenty years of progress have seen the acceptance of Hanovia Sollux Lamps as standard infra-red equipment all over the world In the new Model V practitioners find a lamp which adapts itself to every therapeutic requirement The user works with full guidance regarding indications and technique, and the high power of this new lamp enables him to obtain effective results

TECHNIQUE FOR BACKACHE AND LUMBAGO

Chronic backache can be profitably treated by radiant heat and massage

Acute attacks of what may be called myositis or lumbago are also advantageously treated by means of radiant heat and massage.'—A M A. Council on Physical Therapy

(Sollux Lamp Model V with 6-in Localizer patient at tolerable distance ca 12 ins Exposure 30 minutes minimum to produce deep hyperaemia and complete freedom from pain and stiffness in area treated)

All statements made by Hanovia regarding wave lengths penetration indications and technique of infra red radiation are fully authenticated by scientific and clinical evidence.

The **SOLLUX LAMP**

— MODEL V —

SOME OF ITS POINTS

1 *INTERCHANGEABLE LUMINOUS AND LONG WAVE SOURCES*
2 *Full power adequate for all infra red treatments*
3 *Correct distribution from a designed reflector*
4 *Graduated intensity by rheostatic control*
5 *Full set of accessories Localizers and filters*

The coupon is for your convenience.

A COMPLETE SERVICE.—A comprehensive Guaranty full operating instructions technical aid when needed a complete 185-page Handbook of Technique and enrolment for special actinotherapy magazine are furnished free to every professional user of Hanovia equipment anywhere in the British Empire.

which the treatment will vary with the stage of the disease, and the ovarian factor, for which the administration of folliculin, lutein, and pituitary extract is indicated D V HY (ibid., 1937, No 633), who has collected nineteen cases, states that the characteristic symptoms of syphilis of the ovary are pain of varying severity in the right iliac fossa, due to swelling of the ovary, amenorrhoea, especially in the secondary stage, and menorrhagia or metrorrhagia

417 Puerperal Bradycardia

M L PÉREZ and J ROSENVASSER (*Ann bras Gynec*, August, 1937, p 111) studied the pulse rate and the vago-sympathetic equilibrium in fifty normal women during pregnancy and the puerperium They found that while the average pulse rate was 80 3 in pregnancy, in the puerperium it had fallen to 69 6, which confirms the observations made by previous clinicians as to the tendency of the pulse to become slow during the puerperium They employed a modification of Danielopolu's method, consisting in the injection of a sufficiently large dose of atropine to prevent an inverse initial phase, and came to the conclusion that the normal puerperal bradycardia is due to decreased sympathicotonia and vagotonia, the decrease being more marked in the former so that the vagotonia predominates

418 Uterine Bleeding in Thrombocytopenia

A HILDEBRANDT (*Med Welt* August 7, 1937, p 1103) states that in severe and protracted urogenital bleeding in young subjects a blood examination is sometimes essential, and may reveal as the cause of the haemorrhage an essential thrombocytopenia (Werlhof's disease) Platelets are greatly diminished, except sometimes during the intervals of freedom from bleeding, the coagulation time is normal, but the bleeding time is prolonged Medical treatment of metrostaxis in this condition has had little effect, and the same is sometimes true of treatment by blood transfusions, irradiation of the spleen, and splenectomy The undesirability of ovariectomy or hysterectomy is obvious Two cases are described in which severe and intractable secondary anaemia from menorrhagia and metrorrhagia was found to be due to essential thrombocytopenia As in several cases recently described, vitamin C was of great value in treatment Given orally it caused a cessation of the bleedings, subsequently it was given intravenously for a time—in one patient because the haemoglobin percentage did not rise, in the other because the metrostaxis recurred Later continued oral administration was combined with that of ferrous iron in large doses, pepsin, and hydrochloric acid Clinical cure was speedily attained, but the thrombopenia persisted in some degree A combination of vitamin C and iron therapy has had similar success in the anaemias of childhood and infancy

Pathology

419 Pneumococcus Carbohydrate Inoculation of Infants

J A V DAVIES (*J Immunol*, July, 1937, p 1) reports investigations to determine if the reactions caused in adults by injections of type-specific pneumococcus carbohydrate are also produced in infants A Type I cellular carbohydrate known to be highly antigenic in adults, was used Six infants, aged 7 to 14 months, were given subcutaneously an initial dose of 0 1 mg of carbohydrate Four were given further injections of varying amounts on the twenty-fifth twenty-seventh, and thirty-first days after the first injection Blood samples were taken before and fourteen and forty-one days after the first inoculation Five other infants aged 2 to 12 months, were given intracutaneously an initial dose of 0 01 mg, four being re-inoculated on the twenty-third twenty-fifth, and twenty-seventh days after the first dose Blood samples were taken before and fourteen and thirty eight days after this first inoculation In a third series of five infants aged 4 to 12 months four larger doses were given subcutaneously at two day intervals, blood being sampled before and fourteen days after the first dose Determinations were made of the anti-pneumococcic bactericidal power of the defibrinated blood, of the degree of phagocytosis, and of the presence of agglutinins in some cases the mouse-protective power of the serum was also investigated Only one infant, who had received a single inoculation only, showed a significant increase in Type I pneumococcus antibodies, and this response was moderate and brief One infant was withdrawn from the investigation on account of illness, and the other fourteen showed no response

420 Values of Raw, Cooked, and Tinned Foods

To assess the relative value of cooked, tinned, and raw food diets, E F KOHMAN *et al* (*J Nutrit* July, 1937, p 9) have studied the effects of feeding the three types of diets to comparable series of successive generations of rats, to a single generation selected so as to avoid the effects of heredity, and to weanlings distributed so as to avoid differences due to suckling The same groups of foods were used for each of the three diets, the raw and cooked diets being derived from the same stock of foods Milk was not given in any of the diets Many varieties of foods were tried in about fifty combinations The experiments on successive generations of rats extended over four years, thus eliminating seasonal variations, covered five generations, and involved over 400 rats on each type of diet The rats fed on tinned food were heavier, and bred and thrived better, and their bones showed a higher degree of calcification than those of rats on raw or cooked diets In the series of rats selected so as to exclude the effects of heredity there was no consistent difference in weights attained on the three diets, but there was a consistent higher percentage of ash in the bones of those fed on tinned food A similar result was obtained in the third series of selected weanling rats At necropsy it was found that the rats on raw food diets tended to have an enlarged caecum and a greater amount of food in their digestive tracts than did the others The authors conclude that their experiments show that there is no inherent value in rawness, that cooking need not incapacitate nutrient elements, and that tinned foods afford a good supply of calcium

421 Hippuric Acid Liver Function Test

K YARDUMIAN and P J ROSENTHAL (*J Lab clin Med* July, 1937, p 1046) have applied Quick's hippuric acid excretion test to 100 clinical cases, including cases of liver damage, cholecystitis, and cardio renal diseases, and to fifty control cases without liver damage The test depends on the rate of synthesis of glycine and its conjugation with benzoic acid to form hippuric acid, and involves the hourly determination of the amount of hippuric acid excreted in the urine after giving 5 grammes of benzoic acid in the form of sodium benzoate In the fifty control cases the excretion at the end of four hours corresponded to 3 grammes or more of benzoic acid In cases of positive liver damage, in portal and biliary cirrhosis, in malignant diseases of the liver and biliary system and in jaundice resulting from hepatitis, the output of hippuric acid was diminished In jaundice due to obstruction and in cholecystitis without liver damage the output was normal in chronic obstruction with liver damage, however, differential diagnosis was impossible In cardio vascular diseases the output of hippuric acid was diminished only if there were signs of congestive heart failure In advanced kidney disease there was hardly any excretion of hippuric acid, and, in fact, the test is contraindicated The test is of value in differentiating cases of jaundice with liver damage from those without, and in determining the functional state of the liver in cholecystitis before operation is undertaken Repeated tests are of value in the prognosis of liver damage Toxic symptoms due to benzoic acid may occur and may be of gastro intestinal type or referable to the central nervous system

DESOUTTER

CASE RECORDS

Case No H2029 1934

Mrs B, a patient with a left Syme's amputation, came to see us in 1934 with an appliance that she had been wearing for two years which was ugly, heavy and ill-fitting, and causing her great discomfort As a result of incorrect alignment the steel supports had caused pressure sores to develop at the inner side of the knee and outer end of the stump

The end bearing, which should be the great asset of Syme's amputation, was taking practically no weight, by far the greater part of the weight being taken on a thigh corset with a bearing on the ischial tuberosity Yet, in spite of this, the end pad of the stump was already showing signs of loosening due to the outward lateral movement which took place at every step (see Figure 1) If such end results are obtained, it is small wonder that many surgeons may regard Syme's amputation as unsatisfactory In point of fact a Syme's can be as satisfactory an amputation as any other, when correctly fitted, as the case in question shows

A plaster cast of the stump was taken, the positive copy of which was suitably modified to make use of the weight bearing points under the knee, and to ensure that the end bearing pad could expand without friction whilst taking a full share of weight A leather glove was then moulded to the cast (see Figure 2) and encased in a light metal shin with a thin stainless steel cup forming the end bearing, giving great strength combined with lightness and a smooth outline, the mechanism for the ankle movement being a self contained unit under the end bearing Owing to the fact that the lower end of a Syme's amputation is much larger than the leg above it, it is only necessary to allow the lower end of the leather glove to open the fastenings to the metal shin are quick and simple and so firm that once the limb is on it cannot be pulled off The result is a comfortable light limb of neat appearance (this of no small importance to a woman), taking the weight on the end bearing and below the knee (see Figure 3)

'VARIBAN' ELASTIC PLASTER BANDAGE

VARIBAN BANDAGE constitutes a marked advance on the older methods of treating chronic ulceration of the leg It is made from a specially woven selvedge material possessing highly elastic properties and is impregnated with an antiseptic zinc oxide paste

VARIBAN is self adhesive and combines the principles of firm equable pressure and support to the swollen leg, with the benefit of an occlusive dressing under which the ulcer is protected and is stimulated to healthy repair

In promoting proper circulation, VARIBAN steadily reduces oedema It provides protection to the granulations of the healing ulcer In the majority of cases it is found that pain is either eliminated or greatly relieved from the first application The necessity for ointments lotions, etc is obviated while VARIBAN provides an ambulatory treatment which allows of full activity of the limbs with better results than those following rest in bed alone.

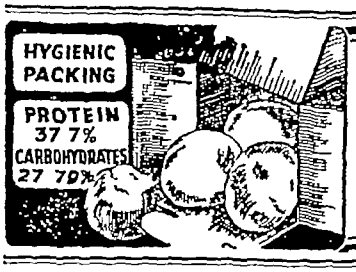
Trade **FORMALGAR** Mark

Formerly known as Gargarisma Formalin Co (Hewlett's)

An excellent preparation containing Formalin, Glyc Acid Carbolic, Tinct Pyrethri, etc When diluted in the proportion of one drachm in eight ounces of water it forms an efficient Gargle for Infectious Sore Throat, etc, or an Antiseptic Mouth Wash

MEDICAL OPINIONS



This is a most economical efficient, and pleasant Gargle and Mouth Wash It is highly concentrated one fluid drachm being sufficient for an eight-ounce bottle It has been employed by dental surgeons for use after extractions etc. and is also suitable for general purposes —MEDICAL ANNUAL

Dr G H speaks very highly of Gargarisma Formalin Co used twice daily (Gargle—1 drachm to 8 oz water) for throat irritation in professional singers

I have tried your Gargarisma Formalin Co and find the patients like it —E W S L D S Eng

"COMMON COLD"

AND

ANTI-CATARRH VACCINE (EVANS)

(LOCAL STRAINS)

For Prophylaxis and Treatment

The resources of the pathological laboratories at **EVANS' BIOLOGICAL INSTITUTE** facilitate the issue of vaccines prepared from organisms collected in the locality in which the vaccine is to be used It will be appreciated that such vaccines are highly specific producing a greater proportion of successful results than is possible with Stock Vaccines

The formulæ have been evolved after many years experience as having a comprehensive selection of the organisms found in numbers of typical cases in the correct proportions

EVANS' "COMMON COLD" AND ANTI CATARRH VACCINES (Local Strains) are issued as follows
Boxes of 3 x 1 cc Ampoules No 3 Vaccine (Prophylaxis) 7/6 per box Also in 5 cc., 10 cc and 25 cc bottles
Boxes of 6 x 1 cc Ampoules No 1 Vaccine (Treatment) 11/- per box and in single Ampoules

Made in England at The EVANS BIOLOGICAL INSTITUTE by

Evans Sons Lescher & Webb Ltd.

Liverpool and London

The ideal blood builder in pregnancy ★

The growing foetus often induces hypochromic anæmia in the pregnant woman, which must be combated with iron in such form as her sensitive stomach and nerves will readily tolerate Ovoferrin, the blood-builder, meets this requirement admirably because it is odourless and practically tasteless It does not affect the teeth and does not constipate It often induces intestinal peristalsis Years of highly satisfactory clinical results have served to classify Ovoferrin as the "ideal haematinic"

Each adult dose of Ovoferrin contains one grain of metallic iron held in colloidal form by a protective protein colloid Ovoferrin is equally effective in children in proportionate dosage

ST. ANDREW'S HOSPITAL

FOR MENTAL DISORDERS

NORTHAMPTON

FOR THE UPPER AND MIDDLE CLASSES ONLY

President THE MOST HON THE MARQUESS OF EXETER C.M.G A.D.C

Medical Superintendent DANIEL F RAMBAUT M.A M D

This registered Hospital is situated in 120 acres of park and pleasure grounds. Voluntary patients who are suffering from incipient mental disorders or wish to prevent recurrent attacks of *mental trouble* temporary patients, and certified patients of both sexes are received for treatment. Careful clinical biochemical bacteriological and pathological examinations. Private rooms with special nurses *male or female*, in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE

This is a Reception Hospital in detached grounds with a separate entrance to which patients can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It contains special departments for hydrotherapy by various methods including Turkish and Russian baths the prolonged immersion bath Vichy Douche Scotch Douche Electrical bath Plombières treatment etc. There is an Operating Theatre a Dental Surgery and X ray room an Ultra Violet Apparatus and a Department for Diathermy and High Frequency treatment. It also contains Laboratories for biochemical bacteriological and pathological research.

MOULTON PARK

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk meat fruit and vegetables are supplied to the Hospital from the farm gardens and orchards of Moulton Park. Occupation Therapy is a feature of this branch and patients are given every facility for occupying themselves in farming gardening and fruit growing.

BRYN-Y-NEUADD HALL

The seaside house of St Andrew's Hospital is beautifully situated in a park of 330 acres Llanfairfechan amidst the finest scenery in North Wales. On the North West side of the Estate a mile of sea coast forms the boundary. Patients may visit this Branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the seashore. There is trout-fishing in the park.

At all the branches of the Hospital there are cricket grounds football and hockey grounds lawn tennis courts (grass and hard courts) croquet grounds golf courses and bowling greens. Ladies and *gentlemen have their own gardens and facilities are provided for handicrafts such as carpentry etc.*

For terms and further particulars apply to the Medical Superintendent (Telephone No 2356 and 2357 Northampton) who can be seen in London by appointment.

PISTANY MUD
for
persistent RHEUMATISM

Different from ordinary heat therapy

Why? Simultaneously with the physiological responses of the body to heat reactions are caused specifically by this hot sulphurous radio active living mud A detailed account of the analytical biological and clinical evidence appears in the September "British Journal of Physical Medicine"

How? It is easy and clean to apply The hot mud is wrapped in Cellophane in which a window is cut to expose the mud surface to be laid on the skin This method entirely meets the conditions prevailing in clinics or homes, and costs very little to apply For demonstration phone LANgham 4214 FULL INFORMATION FROM

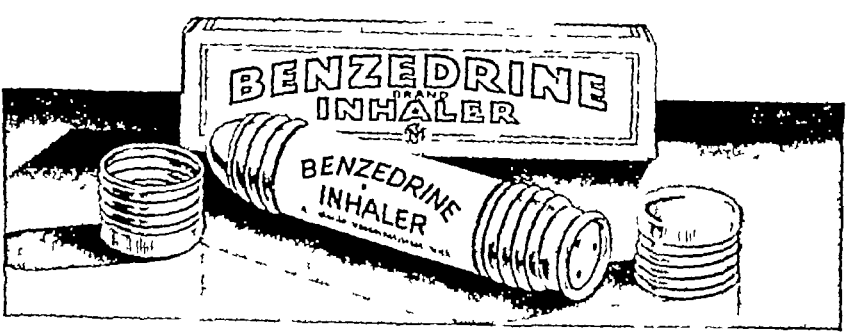
Nasal Sinusitis in Childhood



It has been shown by Crookes (*Arch Dis Childhood* 11 281, 1936) that nasal sinusitis in children is far more frequent than is usually believed, and relatively seldom clears up spontaneously

In such conditions Benzedrine Brand Inhaler is especially valuable Children accept inhaler therapy willingly, exhibiting towards it none of the hostility which usually complicates the administration of liquid vasoconstrictors (Scarano and Coppolino *Arch of Ped* 54 97, Feb , 1937)

Since 'Benzedrine' is volatile it penetrates to areas not readily accessible to liquid inhalants and reduces congestion of the rhinological tract wherever it exists It thus affords maximal aeration and adequate drainage, yet there is no oil to be aspirated and become a potential source of later trouble by accumulating in the lungs (Graef *Amer Jour of Path.* 11 5, 1935)

Indicated for shrinking the nasal mucosa in

HEAD COLDS SINUSITIS NASAL CATARRH
HAY FEVER ASTHMA

Each Inhaler is packed with β-Phenylisopropylamine (Isomyn) 0 325 gm , Oil of Lavender 0 097 gm , and Menthol 0 032 gm

ROYAL NAVAL MEDICAL SERVICE.

Vacancies exist for Medical Officers in the Royal Navy, and applications are invited for entry in January, 1938

Candidates below the age of 28 years are preferred, and they must be registered under the Medical Acts No examination in professional subjects will be held, but candidates will be required to attend for interview by a Selection Board

Selected candidates will be entered for Service for a period of three years in the first instance, which may be extended to five years at the discretion of the Admiralty

At the end of three years' service officers may retire with a gratuity of £400, but those who serve for five years will receive £1,000

At the end of five years' Short Service permanent commissions will be given to selected officers who wish to make the Naval Medical Service their permanent career Officers transferred to the permanent list will receive a gratuity of £1,000 (less Income Tax)

Opportunities are available for officers on the permanent list to specialise, and ample provision is made for Post-Graduate study

Copies of the regulations for entry and conditions of service, including rates of pay and allowances, may be obtained from the Medical Director-General of the Navy, Admiralty, S W 1, and from the Deans of all Medical Schools

Applications for entry from intending candidates must be received not later than November 22nd, 1937

ROYAL NAVAL DENTAL SERVICE

Vacancies exist for DENTAL OFFICERS in the ROYAL NAVY and applications for entry are invited from Registered Dental Surgeons

Candidates must be British subjects of pure European descent below 28 years of age on the day of entry and physically fit for service in any part of the world Unmarried candidates are preferred No examination in professional subjects will be held but approved candidates will be required to attend at the Admiralty for physical examination and interview by a Selection Board

Successful candidates will be appointed to Short Service Commissions and a grant of £50 towards the cost of providing the necessary uniform will be paid on entry Vacancies in the permanent list will be filled by selection from among officers holding Short Service Commissions who desire to make the Royal Naval Dental Service their permanent career Officers not transferred to the Permanent List will on the termination of their Short Service Engagement after six years service receive a gratuity of £1 000

The rates of Full Pay for Short Service Dental Officers are £362 per annum during the first three years and £447 per annum during the second three years Official quarters are provided

Candidates who have since qualifying held full-time appointments as House Surgeons at Dental Hospitals and Schools will be eligible for an antedate of seniority up to a maximum of six months

Officers serving under permanent commissions are eligible for a four months postgraduate course on full pay with allowances

Copies of the regulations for entry of conditions of Service including rates of pay and allowances, may be obtained from the Medical Director General of the Navy Admiralty S W 1 and from the Deans of Dental Schools

Applications for entry in January 1938 must be received not later than December 1st 1937 and for entry in April 1938 not later than March 7th 1938

Two New AMPLIVOX DEAF AIDS

MODELS A8 & C8

AMPLIVOX LTD

106, George Street, Portman Square, London, W 1
Telephone WELbeck 2591/2

29, St. Vincent Place, Glasgow, C.1
Telephone: Central 3097

62a, Bold Street, Liverpool, 1
Telephone Royal 4944

THE AMPLIVOX is obtainable in the United Kingdom only from AMPLIVOX LTD and from Messrs. T. Hawksley Ltd. and W. H. Pettifor. There are agents in Australia Denmark France Holland the I.F.S. Sweden India N. Ireland and Norway

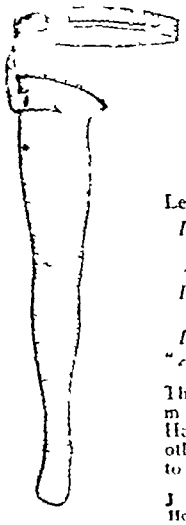
It is being widely appreciated by the Medical Profession that in all forms of deafness the best results are given by a valve aid. One of our competitors remarked that AMPLIVOX LTD had done more to bring this about than any other firm a compliment which we hope we deserve for the highest possible performance has been the aim of all our development work.

The new models have two distinctive features —

1 All dry battery working

2 Complete absence of connecting wires

They are smaller and lighter in weight than previous models. The frequency range of the complete instrument (microphone amplifier and earphone) is from 100 to 6 000 c p s. The maximum amplification is 55 decibels.



Model A 8 has a high quality carbon microphone and costs 12 guineas

Model C 8 has a piezo electric crystal microphone and costs 17 guineas

An AMPLIVOX deaf aid will gladly be sent for clinical test and may be taken away for a week on trial before purchase for a small fee

A copy of the AMPLIVOX brochure describing all models and giving much interesting information on hearing aids will be sent on application

"Solvitur Ambulando"

The great advances in recent years in prostheses for the lower extremities are exhaustively described and illustrated in a 72 page book under the above title

Copies gratis to the Medical Profession on application

Leading members of the Profession write —

I congratulate you on this interesting instructive and artistic production I consider it to be a very great addition to my library —M B Ch B F R C S

A very excellent brochure on artificial limbs —M S F R C S

It will prove most useful for reference —M D LL.D F R C S

I most exquisite production and I am glad to have it —M S M D F R C S

I congratulate your firm on the excellence of this book —M A Ch M M B., F R C S

"*A delightfully produced book*"—K C M G M B B S F R C S

This book is the result of practical experience gained in rehabilitating over **100 000 amputees** by the Hanger establishment. Many times larger than any other limb maker in the world. It is devoted solely to making and fitting artificial limbs alone

TWENTY-FIVE per cent. of the flour from which the HOVIS loaf is produced is wheat germ

Science advocates the use of germ-bread as a factor in promoting nutrition That is why HOVIS figures so prominently upon the dietary when the question of food value must be studied In white bread, the wheat-germ is practically non-existent This vitalising source of protein, fats and phosphates abounds in HOVIS In fact, twenty-five per cent of the flour from which the HOVIS loaf is produced, is WHEAT-GERM Apart from its low starch-content, HOVIS is practically free from bran and indigestible cellulose This factor makes HOVIS supreme for easy digestibility and assimilation

Every morning we receive evidence of how good Numol is for growing and ailing wives & Goup

These two letters arrived whilst this advertisement was being written

I have given NUMOL to my two little girls, aged 3 and 4, after a severe attack of Whooping Cough and have found that they are putting on weight and getting rid of the cough It is a great food and I bless the day my Doctor advised me to try it
(Mrs H., of Galashiels, 27th Oct., 1937)

My little girl, aged 7, is going on splendidly since she began taking NUMOL I find NUMOL a great benefit and, above all, it is very pleasant to take, which is a great thing to children
(Mrs F., of Cramlington, 27th Oct., 1937)

NUMOL

IS A VALUABLE FOOD FOR CONVALESCENTS

TRADITIONAL LONDON

OLD ST PAUL'S about 1540

This view of Old St Paul's is of the second cathedral commenced in the 11th century eventually becoming the largest cathedral in England with a graceful spire rising to 520 ft. It was twice consumed by fire, in 1440 and 1561 and at the Restoration this second cathedral was almost a ruin

The first stone of the present cathedral of St. Paul was laid on June 21st, 1675.

Life and Death

by ANDREA MAJOCCHI

The autobiography of a surgeon

Dr Majocchi's book is almost wholly objective It is an extremely readable account of his life as a surgeon

From the beginning incident tumbles over incident, often of a hair raising character It is a happy book—the book of a deep hearted man happy in the self acrifice of his great mission —*The Observer*

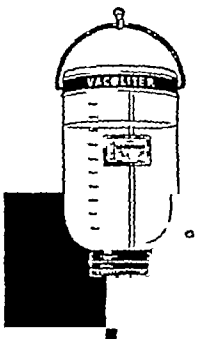
IN THE PAST ~~6~~ 10 MONTHS ~~87~~ 245 HOSPITALS HAVE TESTED AND APPROVED OF THE **BAXTER "VACOLITER"**

THEY FIND THIS SERVICE



UNIFORM · SAFE · ECONOMICAL

PROVED

Before a single litre of Baxter s solutions was sold to the profession generally, there was a history of five years of research, plus two years of development, then three years of successful clinical use by a selected group of hospitals We could not afford to guess —nor can you Baxter s solutions in Vacoliters are always sterile, ready to use and instantly available We have been able to prove to many hospitals that they bring the advantages of safety and improved service at *reduced cost*

TESTED

In the three laboratories devoted exclusively to the preparation of intravenous solutions, not a single item is left to chance. Each mixture of solution must prove itself by passing exhaustive tests and inspections These tests include a more than adequate biological check complete bacterial yeast and mould tests at incubator and room temperatures, chemical assay checking of the *p*H and visual inspection with special equipment. This constant vigilance is your protection and ensures absolute freedom from all reactions

For Delicate Adults and Children

"Lixen" is an extract of senna prepared by a special cold process to allay the griping action The absence of an after-constipating effect gives it a special value in habitual constipation, and its gentle, though efficient, action, together with its pleasant flavour, makes it particularly acceptable to women, children, elderly and delicate persons, and convalescents, for whom the finding of a satisfactory aperient is often difficult.

Descriptive literature and clinical sample will be sent on request

"LIXEN"

The treatment of Urinary Infections

The value of mandelic acid therapy in urinary infections is now established, and one or other of its salts, for example, ammonium mandelate (Mandelix) or calcium mandelate (Mandecal), is administered by the physician in practice in full assurance of a certain well-defined therapeutic effect

MANDELIX

Mandelix — an elixir of ammonium mandelate — provides a means of practising mandelic therapy in its simplest form, inasmuch as by its use the pH of the urine is maintained at the prescribed level without the collateral administration of ammonium chloride Its administration results, even in cases having a chronic infection, in the establishment of sterile urine within a week

MANDECAL

Mandecal is a pleasantly flavoured preparation of pure calcium mandelate in powder form Being readily miscible with water it is simple of administration, it is therapeutically effective and its administration is not followed by any dyspeptic discomfort such as that which occasionally occurs during protracted treatment with other mandelic acid preparations

"ALOCOL"

Colloidal Hydroxide of Aluminium

For Gastric or Duodenal Ulcer

IN view of the increasing adoption of intensive alkaline medication for gastric and duodenal ulceration, the selection of a suitable antacid agent is a matter of considerable importance to the general practitioner

Alocol ' allows of antacid therapy in a particularly effective, safe and reliable form, and replaces with advantage mixtures composed of sodium bicarbonate, magnesia bismuth etc It does not determine any unpleasant secondary reactions, even when taken in strong doses and over a long period of time

The powerful antacid effect of "Alocol" is more mechanical than chemical in nature It acts by adsorbing excess of hydrochloric acid thus facilitating its elimination It promptly relieves pain and being non absorbable is free from toxic sequelae

Complete chemical history of Alocol with convincing clinical reports and supply for trial sent free to physicians on request

A WANDER, Ltd, Manufacturing Chemists,
184, Queen's Gate, London, S W 7

Works KING S LANGLEY HERTFORDSHIRE M282

FOR EFFECTIVE CONTROL OF PAIN

AMONG the many and diverse analgesics which have been evolved by modern chemical research acetyl salicylic acid retains its reputation as one of the safest and most effective Its tendency to liberate salicylic acid—the irritant properties of which are well known to physicians—has, however, caused many to hesitate to employ it as widely as it deserves Exhaustive trial in hospital and private practice proves that ' Alasil definitely solves the problem of administering acetyl salicylic acid in an effective form being free from the risk of irritating the stomach or bowels or of causing general reactions

A supply for clinical trial with full descriptive literature sent free on request

In Alasil" the desirable therapeutic effects of acetyl salicylic acid are well exhibited by its calcium acetyl-salicylate moiety while the presence of Alocol" (Colloidal Hydroxide of Aluminium) a powerful gastric sedative and antacid, obviates any tendency to gastric irritation The superior absorbability of Alasil" over ordinary salicylate compounds and its freedom from the risk of liberating free salicylic acid in the stomach have been well proved by careful experimentation Alasil can be prescribed with perfect safety to patients of all ages and in larger doses than ordinary salicylate compounds

AUTHORS AND TITLES	DETAILS	COMMENTS
MUNRO KERR OPERATIVE OBSTETRICS	FOURTH EDN Pp xii + 848 with 338 illustrations 45*s*	Still maintains its position as the premier volume on operative obstetrics in the British Empire There is a wealth of good illustrations which are practical and convincing to the reader His ideas are crystallised with a wealth of clinical observation *Medical Press and Circular*
GRIMSDALE & BREWERTON OPHTHALMIC OPERATIONS	THIRD EDN Pp x + 322 with 105 illustrations 17*s* 6*d*	This work the only one of its kind on this special subject is a most valuable one and reflects the greatest credit on its authors No ophthalmic surgeon can we are confident afford to be without it *British Medical Journal*
MACKENNA DISEASES OF THE SKIN	FOURTH EDN Pp xvi + 558 with 46 coloured platesand 170 figs 20*s*	One of the most lucid and practical guides for students and practitioners far easier and pleasanter to read than the majority of text books The clinical descriptions are exceptionally clear and both the choice and reproduction of the plates are excellent *Practitioner*
GASH & ROSS SYMPATHETIC NERVOUS SYSTEM	SECOND EDN Pp xii + 186 with 49 illustrations, including 13 plates 16*s*	Without doubt this is the most practical and quite the most useful book on this subject that has so far been published It is not often that a book appears which has such a distinct appeal not only to the student and surgeon but also to the backbone of the profession the general practitioner *Medical Press and Circular*
DONNISON CIVILISATION AND DISEASE	Pp xvi + 222 10*s* 6*d*	A new work embracing the fields of medicine psychology and anthropology and dealing with the relationship between civilization and the incidence of various diseases The essential thesis that emerges is that psychological factors are mainly responsible for the diseases of civilization Foreword by Sir Walter Langdon Brown
WILLIAMS MINOR MALADIES	SEVENTH EDN Pp xii + 422 10*s* 6*d*	Always valuable it has asserted itself as an indispensable storehouse of practical advice and scientific treatment It is so easy to read that it seems more like an interesting story book than the scientific work that it is It will be the greatest help to the practitioner in his daily work *Medical Press and Circular*
ABRAHAMS & WIDDOWSON MODERN DIETARY TREATMENT	Pp x + 328 8*s* 6*d*	This book is essentially practical There is no other small handbook in the English language with so much accurate information about diet and so little verbiage It will be greeted with joy Can be strongly recommended to medical practitioners and students nurses and hospital dietitians" *British Medical Journal*
TREDGOLD MENTAL DEFICIENCY	SIXTH EDN Pp xviii + 556 with 34 plates. 25*s*	"As a textbook we know of none to approach this for completeness accuracy and clearness of description. Dr Tredgold writes with authority out of a rich experience He has certainly given us a genuine medical classic which must for many years to come remain the standard work on this subject *Medical World*

GASTRIC DYSTROPHY

Sanatogen

To remedy Malnutrition and to build Stamina

WHATEVER the cause of malnutrition, the symptom of gastric inefficiency is usually present, and something is required to alleviate this and stimulate metabolism Sanatogen answers these requirements perfectly It consists solely of 95% pure milk casein and 5% sodium glycerophosphate in *chemical combination* Therefore, containing no sugar, starch or fat, it can safely be prescribed in diabetes and other conditions exhibiting definite metabolic interference, and, being most easily digested and assimilated, it is especially useful in those instances where severe gastric inflammation prevents the adoption of a rational diet

Investigations have clearly demonstrated that the regular administration of Sanatogen definitely increases cellular activity, enhancing fatigue-resistance (often synonymous with disease resistance) to a remarkable degree

Sanatogen is readily absorbed by the stomach and has an immediate and remarkable effect, shown by a steady increase of body weight and of muscular strength and energy Patients who have grown thin as the result of chronic maladies put on flesh at the rate of one or two pounds per week or even more in some instances At the same time the colour is brought back to the patient's cheeks That this last mentioned result is due to a specific increase of red blood corpuscles has been shown by repeated and skilled examination of the blood of persons going through a course of feeding by Sanatogen

'A dietetic par excellence even in the feverish state of typhoid fever (LANCET)

'*Equally good results are met with by the administration of this remedy in acute diseases attended by wasting and prostration It stays the appetite in a way attainable by no other means in the hunger that usually marks the recovery stage of typhoid fever Its feeding and sustaining properties are invaluable in the complete loss of appetite that often spells danger in attacks of Influenza. To nourish the patient then becomes a matter of life or death and under these circumstances the supreme importance of highly nutritive and absorbable food in small bulk is recognised*

(From a paper published in the Medical Press and Circular)

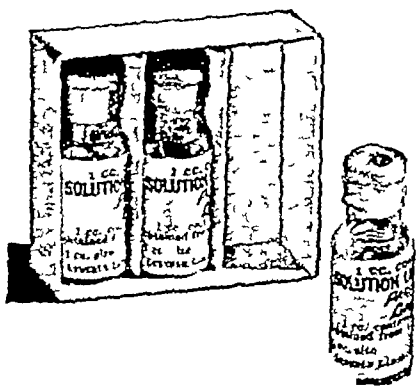
for Pernicious Anaemia

1 cc CONCENTRATED SOLUTION LIVER EXTRACT

Lederle

THE EXTENSIVE CLINICAL USE of this product during the past two years has demonstrated that pernicious anæmia may be adequately treated by the use of this refined extract



According to our interpretation, adequate treatment implies the treatment of other disease symptoms aside from those referable to the blood (number of red cells, hæmoglobin, cell volume), the gastro-intestinal tract (glossitis, diarrhœa, loss of appetite) and the nervous system (peripheral and central)

Extensive neurologic involvement frequently requires intensive therapy over a long period of time to bring about improvement In the presence of marked nervous system changes a large amount of active substance is indicated, far in excess of that required to bring about a complete blood remission Infection and advanced age usually add to the requirements for active material

Clinical experience of the last five years has definitely shown that parenteral liver therapy is the most effective and most economical method of treating pernicious anæmia

1 C C CONCENTRATED SOLUTION LIVER EXTRACT *Lederle* offers many advantages to the physician and the patient—

- Rapid improvement during relapse.
- Maintenance with a relatively small number of injections per month
- A minimum of inconvenience to the patient with each injection
- Provides intensive therapy, still with little inconvenience, for those patients with extensive neurologic involvement

B.D.H. SEX HORMONE PREPARATIONS

OESTROFORM The ovarian follicular hormone in its pure, accurately-standardised form
For use in infantilism and delayed puberty, pruritus and kraurosis vulvæ, menopausal disturbances and all cases of ovarian hypofunction when an immediate effect is required
GONAN The gonadotropic substance from pregnancy urine For use in dysmenorrhœa also in cryptorchidism
SEROGAN The follicle-stimulating substance from the serum of pregnant mares For use in ovarian hyposecretion, also to render more permanent the somewhat evanescent effects of Oestroform
PROGESTIN B D H The hormone of the corpus luteum For use in habitual abortion and menorrhagia.

OF PREVENTIVE MEDICINE

Compound
Catarrhal Vaccine

In catarrhal conditions of the respiratory passages mixed infections are found more often than pure infections with one type of organism *Bacillus influenzæ* Pneumococcus and Micrococcus *catarrhalis* are believed to be the commonest primarily infecting organisms but Streptococcus and Staphylococcus seem to be responsible for many of the secondary infections A mixed vaccine has been prepared from these five kinds of bacteria It is generally given as a prophylactic but may also be used in acute respiratory infections

DOSAGE.—Prophylaxis 1st dose, 50 million *B influenzæ* 10 million Streptococcus, 25 million *M catarrhalis*, 25 million Pneumococcus, 125 million Staphylococcus Subsequent doses at intervals of 7 to 10 days, gradually rising to 8 times the original dose. Then 4 to 8 times the initial dose every 4 to 8 weeks

Treatment—$\frac{1}{10}$ to $\frac{1}{4}$ of the prophylactic doses.

PRICES—Ampoules containing

235	million organisms per c.c. each	2/6

How the Purity of LACTOGEN is Ensured and Safeguarded

In the production of Lactogen, every possible safeguard and precaution is taken to ensure the maintenance of purity at every stage

Only the purest and richest cows' milk, after special tests, is used in the preparation of Lactogen

Right through the process of manufacture, rigid safeguards are taken to ensure freedom from contamination

The finished product, which is untouched by hand throughout, is packed in specially designed airtight containers as a final safeguard

Thus Lactogen, which in proportions and in physical characteristics so closely resembles breast milk, is also the safest food that it is possible to obtain

Sterility and Habitual Abortion

There is a growing consensus of opinion that dietary deficiency of Vitamin E may be more widespread than had previously been suspected The use of wheat germ oil in the treatment of cases of sterility and habitual abortion arising from this deficiency is the result of research extending from 1920 until the present day This treatment, according to published reports, has been successful in about 70 per cent of cases The classical experiments were all carried out using whole wheat germ oil The difficulty of repeating such work in practice, owing to the rapid development of rancidity in the oil, is overcome by the use of Fertilol, a stable oil of wheat germ specially prepared to prevent such deterioration Its activity is high and has been found to be unimpaired on storage

"Vitamin B_1 deficiency an outstanding fault in the diet of many millions of people"

(*B M J Oct* 16, 1937, *p* 753)

The reduction in Vitamin B_1 intake, due to changes in dietary habits during the last hundred years, normally amounts to at least 50 per cent and may be as much as 70 per cent It has been demonstrated, both experimentally and clinically, that a shortage of Vitamin B acts as a limiting factor in the maintenance of health and nutrition, and often results in gastro intestinal disorders, loss of appetite, indigestion, constipation and, if long continued, to neuritis and arthritis

The logical way to rectify such shortage is to restore to the diet the Vitamin B-containing substance whose removal is responsible for the deficiency

This substance is available in the form of Bemax

For years it has been the policy of the proprietors of Bemax to ensure its Vitamin B_1 activity by biological assay of *every day's output* So far as is known, Bemax is the only food product for which such a claim is or can be made

The quantity of Vitamin B_1 supplied by the normal daily dose of Bemax—one tablespoonful—is 200 International Units, an amount sufficient to raise a deficient diet to an optimal level

The normal daily dose of Bemax supplies, in addition to Vitamin B_1, significant quantities of Vitamins B_2 and B_6, Copper, Iron and Phosphorus as well as rich quantities of Vitamin E and other essential dietary elements

Bemax is an entirely natural product consisting of stabilised wheat germs selected for their Vitamin B_1 activity with no addition whatsoever

Clinical sample and literature on request The Bemax Laboratories 23, Upper Mall Hammersmith, W 6

CALFO-RAYOL

SQUIBB

Even though much remains to be learned concerning the importance of calcium in nutrition, these facts are definitely known that adequate intake of the mineral is essential for the maintenance of health, that its effectiveness depends upon its availability in proper ratio to phosphorus, that Vitamin D is essential for utilisation of these two elements by the body, that the average diet is deficient in calcium, and that this deficiency may be met by a dietary supplement

Each tablet of CALFO-RAYOL contains.

CALCIUM
—2 6 gr derived from dicalcium phosphate 9 gr and calcium gluconate 6 gr

PHOSPHORUS
—1 6 gr derived from dicalcium phosphate 9 gr

VITAMIN D
—660 International units supplied in form of Irradiated Ergosterol

THE BRITISH DRUG HOUSES LTD LONDON N 1

Rstm/S/331

It might have been thought that insurance companies would possess collective statistics about incidence and prognosis of mental disorders after such accidents The companies, if possible, tend to settle claims within the first year after accident One would, however, expect *a priori* that a settlement would be related to such collective statistics They exist in the case of epilepsy but not of mental disorder This is no doubt due in part to the difficulty of defining mental disorder, but since this disregard applies in respect of persistent psychosis one must ascribe it partly to the prevailing underestimation of this as a sequel

In the absence of satisfactory civilian statistics one might turn for help to the records of military casualties It is obvious that fractures of the skull in war are accompanied by laceration of the brain and by infection far more often than those in civil life But apart from such factual differences, there are discrepancies between military and civil findings which cannot be reconciled This would seem to depend upon the fact that the conclusions as to *military cases have been based on an acquaintance with* cases that was not close enough or not long enough, upon failure to define terms, and upon other statistical fallacies which will presently be considered

Official figures concerning casualties of war, both those *derived from British and those from foreign sources,* agree in dismissing as insignificant the influence of head injury in causation of either neuroses or psychoses In *my view this tendency is greatly overdone*

It is, of course, a truism that of the total of those who were recognized as suffering from a persistent neurosis or *psychosis which became manifest during military service,* and who have been pensioned or treated by the Ministry for these disabilities, a vast majority owed their disability to a combination in varying degree of neuropathic predisposition and emotional stress It is further true that of the total number of cases of neurosis and psychosis of war, those which are in any degree the result of serious head injury form a very small proportion indeed But it may be not merely a logical error to suppose that this last statement can be inverted, it may be one apt to result in grave injustice in both military and civil cases *It may be* wrong, in a patient with a history of head injury and with a syndrome indistinguishable from one of those that occur functionally, to dismiss as negligible the chance that the main factor of this syndrome is the physical effect of the head injury

I propose to deal separately with the problems of neuroses and of psychoses of war and briefly with the former, because there are no civilian figures regarding incidence of neuroses, either with or without head injury There can therefore be no quantitative evidence from civilian sources as to the probable fallacy involved in disregarding minor mental sequels of gunshot wounds of the head

My personal experience and that of the Maudsley Hospital would indicate that it is extremely difficult to discriminate sharply the minor organic element in many such cases from accompanying neurosis But our experience would suggest that, so far as such discrimination is possible, even in healthy young adults persistence of organic mental disability which unfits for employment is very common

It seems incredible that patients the subject of head injury due to war do not suffer in many cases from residual mental symptoms like those of the 'traumatic psychasthenia' that persists in imperfectly recovered civil cases That such cases do not appear among those drawing pensions for war neuroses may be due to the fact that while suffering from the usual syndrome they receive their pension for "G S W head" That they do not figure among those treated at Ministry of Pensions clinics and hospitals is due to the same fact they do not have to attend More often than in the case of patients with neuroses of emotional origin they are men of an independent type who try to bear the ill they have and get on with it

Turning to the problem of post-traumatic psychoses there is more to be said While special factors may operate to some extent in war cases, on the whole there is a very close similarity in the reasons which have led to the underestimation of the influence of head injury in causing psychoses, whether in peace or in war, this gives the problem a continuing importance

The total incidence of insanity in cases of "G.S W head" according to British official records is the same as that for the general male population, which varies from 0 34 to 0 35 per cent I am informed that experts attached to the German and French equivalents of the Ministry of Pensions stated that they had no evidence other than the cases of actual dementia and mental deterioration after damage to the brain to suggest that psychoses followed 'G.S W head" Their experience showed that psychoses in general and schizophrenia in particular were as frequent among the civilian population as among men wounded in the head It is notable that the same experts rejected the belief that trauma might have any influence in accelerating the course of neurosyphilis—a belief held by most clinicians whose experience is detailed rather than statistical

It is like putting science in blinkers to disregard, in considering such statistics, the possible preconceptions of those who collect them and who draw the deductions I am afraid that as a clinician I am left obstinately convinced that some undue scepticism on the part of officials tired of importunacy must here be allowed for The figures indicate that, apart from gross damage to brain, head injury of war has no influence whatever in determining psychoses Surely this is too good to be true When a clinician has seen the immediacy with which, in civil cases, psychoses evolve from the early syndrome following concussion without gross damage and either clear up or persist, can he accept such conclusions? Usually he will have seen even a few war cases having such immediate relations But whether he has done so or not, will he be prepared to believe in such a mysterious difference between psychotic sequelae in war and in peace?

On the contrary, the clinician will be set looking for possible sources of statistical fallacy, and I think here he will easily find half a dozen or more

(i) Statistics are of negligible value unless confined to cases in which 'G S W head" is grave enough to have some real *effect on the brain In so far as statistics of serious cases* are diluted with others of mere scalp wounds, naturally incidence of physiogenic mental disorders will approximate to normality

(ii) The ratio expressing incidence of insanity or of schizophrenia in the male population is not one of astronomical constancy It has a wide range of variation with age, time and place This might allow of some extra incidence among men with 'G S W head without such increase being obvious (The extra incidence among civilians with serious head injury is far beyond the range of normal variation)

(iii) It is likely that among those liable to "G.S W head" (mostly front line soldiers) the tendency to such psychoses as idiopathic schizophrenia is below average If so, incidence up to average would indicate not indifference of G S W head but, on the contrary, its influence in off setting natural immunity

A DISTINCTIVE PRODUCT WITH A TWO-FOLD PURPOSE

EMULSIO SULPHONAMIDI

(EMULSION OF p-AMINOBENZENESULPHONAMIDE WYLEYS)

An effective bactericide and prophylactic for employment in the oral treatment of Acute Puerperal Sepsis, Erysipelas, Tonsillitis, and Gonococcal Infections

Reports announce In one hospital the maternal mortality of puerperal fever was reduced from 22 7 to 4 7 per cent And Of 47 cases of gonococcal infections of the genito urinary tract 36 showed that the gonococci and urethral discharge had cleared up in less than five days

A pleasantly flavoured product containing 7½ grains (0 5 gm) of p Aminobenzenesulphonamide in each fluid drachm (4 c.c.)

Price 6/ per 8oz. bottle 16oz. 11/6 In bulk 11/ per lb

example, those complicated by epilepsy or arteriosclerosis If cases were admitted early it was commonly on account of some antisocial propensity such as epileptoid mental paroxysms or persistent demoralization This bears out the view that the number of those certified as suffering from insanity due to head injury gives no real estimate even of the psychotic results due to this cause

2 During the same period 4,000 patients were admitted to two of the London observation wards which I visited weekly Of this total sixteen were suffering from mental disorder clearly attributable to head injury—approximately 4 per 1,000 admissions The majority fell into two subgroups to one the same remarks apply as to mental hospital cases The other subgroup was made up of quite early cases too troublesome to nurse in ordinary wards on account of "cerebral irritation" or similar restless excitement, from which they were suffering when first seen

3 Among 7,000 consecutive registrations at the psychiatric out-patient clinics of North London which are an offshoot of the out-patient department of the Maudsley Hospital there were forty-six having a definitely causal relation between symptoms and head injury—a proportion of nearly 7 per 1,000 This figure is intermediate between that for the mental hospitals and observation wards on the one hand and private practice on the other The reason, of course, is obvious

4 A final group of patients to be considered comprises fifty-one with the same causal relation who were treated as in-patients at the Maudsley Hospital during the years 1923 to 1936 among a total of 7,000 (this group of fifty one included fifteen derived from my own series of ninety-two) The patients of this group have been specially studied by Dr Tennent

Of these Maudsley in-patients thirteen might have been classified as neurotic and thirty-eight as psychotic The first qualification for admission was either good prognosis or scientific interest but there is naturally a tendency to treat in the wards patients with relatively severe sequels and to deal as out-patients with those having relatively minor consequences (either psychogenic or physiogenic)

Since the number in this series is too small, and since admission was selective and was based on three independent reasons, no general conclusions can be drawn as to the incidence or the prognosis of traumatic mental disorder as a whole or of particular forms of this But the series possesses considerable value as a set of examples because it has proved possible to trace all patients of the series and without exception to ascertain their present condition—in many cases years after treatment The series at least suggests in a preliminary way the future which may be anticipated for a number of syndromes and the influence upon prognosis of a number of complicating factors additional to the head injury

Detailed study of clinical records of all the cases figuring in Tables I and II reveals occurrence after head injury and, within at most six months of a large number of psychotic sequels of both the psychogenic and physiogenic types

CVS—138

While that order is constant the total duration of recovery may vary from one hour or less to weeks or months Not only so, but the duration of halt at particular stages of the sequence is variable Secondary dissolution may reverse the order of recovery

Such principles will appeal to any psychiatrist whose general outlook is influenced by the thought of Hughlings Jackson These principles represent the generalized organic syndromes of traumatic mental disorder as a sequence, the connexion between which is inherent in the normal structure of the central nervous system

Economy of hypothesis renders such a view preferable to another which seeks cause for separate syndromes in distinct pathological processes The onus is upon those who hold the second view to demonstrate the alleged specific changes, and it seems very doubtful that this can be done

On the one hand an early stage in recovery of post-traumatic mental disorder ("cerebral irritation") and on the other hand the final stage (what I like to call traumatic psychasthenia) have by separate observers been ascribed to cerebral oedema If in either case manometer readings of the cerebrospinal fluid or ventriculograms were decisive or if the results of hypertonic treatment were conclusive then we should have to accept these findings regardless of theory, no such proof exists so far as I know

Traumatic Schizophrenia and Paraphrenia—As a universal stage in the process of recovery there seems to occur a generalized disturbance which corresponds to the essence of the schizophrenic and paraphrenic syndromes (as these are seen in their most common form—the idiopathic or endogenous) Again something has to be allowed for age, rate of progress, duration, and the addition to the clinical picture in traumatic cases of disabilities due to grosser and even localized damage My findings seem to show that the occurrence of schizophrenia or paraphrenia as a stabilization of a universally occurring schizoid stage is common, that relapse into such a psychosis in a few months is frequent, and in either case the attack may be transient or the change lasting

With regard to evidence of prior neuropathic tendency, frequency is much less with schizophrenic and paraphrenic sequels than with affective disorders

(*a*) In a proportion of the cases there is evidence of prior schizoid or paranoid disposition (previous attack persistent abnormality of some degree or strong family history) Even here it is to be noted that the evolution of a psychosis which incapacitates the patients usually occurs after the accident without interval (*b*) In a somewhat larger proportion the psychosis of the same type develops a few months after the accident in a patient who has no pre-traumatic history indicating such liability this is comparable to what commonly occurs with traumatic epilepsy (*c*) In a proportion larger than the two former combined a psychosis of the same type develops with neither interval nor evidence of pre traumatic tendency

In the face of such evidence it is unscientific to dismiss such sequels as due merely to coincidence or to the antedating of a tendency that anyhow would have become overt later There is no reason to regard the causation as psychogenic In fact, the conclusion cannot be escaped that a considerable number of psychoses of schizophrenic and paraphrenic type occur as direct and physiogenic sequels of head injury

Traumatic Psychasthenia—I believe persistence of ultimate incapacity for employment by mental disabilities which are not gross and obvious to be more common than Dr Symonds does The physical character of the condition is indicated by the almost constant incidence of headache and dizziness, especially on stooping or moving the head Allowing for differences attributable to age of onset, to rate of progress, and to duration, the content of this terminal stage corresponds pretty closely to that covered by the inclusive term "psychasthenia" according to its usage by Janet I feel that this term, which has been allowed to become obsolete, would serve a useful function as a comprehensive category covering negative and positive symptoms due to derangements at the highest mental level It seems to have the same sort of right to recognition as the accepted term schizophrenia—namely, a right based on specially frequent coexistence of certain symptoms and minor syndromes in different cases, and upon the fact that these same symptoms and minor syndromes are apt to occur successively in a single case

Prognosis of Mental Disorder Associated with Head Injury

This prognosis depends primarily on how far the association is (*a*) accidental, (*b*) psychogenic, (*c*) physiogenic

(*a*) No discussion is possible here of cases in which head injury is not one factor of the mental disturbance It is of course never the single cause there are no single causes in psychiatry

(*b*) *Psychogenic Disturbances*—(i) Major attacks of affective disturbance and major paranoid states run their characteristic course If purely affective they are not influenced in any specific way by being related to trauma

(ii) Minor affective reactions including anxiety states being less related to constitutional bias and more to the emotional shock of trauma and the damage wrought to the patient's health and circumstances tend to last as long as this damage and to improve in so far as it can be reduced The prognosis of hysteria depends on the importance of the constitutional factor and the motivation When related to compensation it will usually clear unless so protracted that a taste for idle invalidism has become ingrained

(*c*) *Physiogenic Results*—(i) The occurrence of fracture of skull or of compression by haemorrhage in early stages has no importance other than any which it may derive from likelihood of being associated with grave damage to the brain There seems to be no evidence as to total frequency of known presence of fracture in two groups respectively—namely those in which after consciousness fully returns *some* mental derangement persists and those in whom none does But it seems that known presence of fracture is proportionally as common among those cases in which mental disorder never exceeds a *neurosis* as among those in which it amounts to psychosis."

(ii) Certain of the specialized forms of organic mental disturbance clear up in the great majority of cases so far as they themselves are concerned This applies to cortical anaesthesia and paresis to agnosia and apraxia, and to sensory and motor aphasia But they are present in cases where serious damage to the brain has occurred, and there is greater likelihood of persistent traumatic psychasthenia following.

(iii) The same principles apply in the case of Korsakoff's psychosis—namely almost invariable disappearance of the syndrome itself, but frequent persistence of traumatic psychasthenia in the same patient.

(iv) The occurrence of traumatic epilepsy is of specially bad prognosis development of progressive dementia is common with this

(v) The outlook in cases with epileptoid mental paroxysms or with persistent demoralization is almost uniformly bad

(vi) In many cases with an acute schizoid or paranoid syndrome that develops during the acute phase of the illness this clears up

(vii) Disappearance of the same syndromes is less frequent if they follow after any interval however short, of apparent normality

The Product of Unique Experience

The obsolete gas combustion furnace shown here is the actual piece of equipment with which the correct formula of Adrenalin was determined in 1901 in the Parke-Davis Research Laboratories

ADRENALIN

(P, D & Co)

PARKE, DAVIS & CO introduced Adrenalin to the medical profession in 1901 During the thirty-six years that have elapsed, they have manufactured it continuously, and their long experience enables them to offer a natural product that is unsurpassed in effectiveness and purity

Adrenalin (P, D & Co)—the original and well-tried preparation—is extracted from the medullary portion of selected adrenal glands The isolated substance is then standardized by both physiological and chemical methods to secure full activity of the finished preparation

Medical men can make sure of obtaining Adrenalin products that are potent uniform in action, and reliable by specifying "P, D & Co"

Full particulars of Adrenalin (P D & Co) and its use will be supplied on request.

PARKE, DAVIS & CO, 50, BEAK STREET, LONDON, W 1

Laboratories Hounslow Middlesex Inc U S A, Liability ltd

several cases in which the patients for weeks were almost continuously noisy and unruly throughout their waking periods As the patient's abusiveness subsides and it becomes possible to carry on a conversation with him, two features become apparent—confusion and perseveration of words Thus

How old are you? Eh?—How old are you? How old am I?—Yes I don t know—What is your work? I sell things—What do you sell? Oh everything—What kind of things do you sell? Oh everything—Do you sell motor cars or vegetables or what? Everything—Do you sell motor cars? No, everything—Do you sell oranges? Yes, everything.—Have you a shop? No, everything.

A patient who has been noisy for any length of time is likely as he becomes more controlled to remain talkative for a considerable further period His talk circles round a very limited number of ideas and is characterized by frequent repetition, thus revealing both the perseveration of his ideas and the deficiency of his memory At the same time elation is likely to make itself apparent as a feature of his mentality, so that he becomes generally pleased with himself and his surroundings, and is what is commonly called "fatuous"

DISORIENTATION AND CONFABULATION

There may follow a more subdued state in which the patient answers rationally but is disorientated in time and place This again may last many weeks

One of my patients a consulting engineer, spent a considerable part of his recovery period (in imagination) in India inspecting a line and locomotives with which he had been concerned several years before, and when questioned he was ready to confabulate about his daily visits to India Another, confined for months to hospital, used to describe visits to his own home and the very questionable goings-on of his grown-up sons and daughters These two patients thus showed all the elements of Korsakoff's psychosis One of them had a good deal of subarachnoid haemorrhage, and I think that, apart from this, confabulation is uncommon, in my experience it does not occur during the more rapid recoveries

THE RETURN OF MEMORY

During this time memory begins to return The answer to the question Have you ever seen me before?" instead of being No or 'I don t know" becomes 'Yes, I think so,' and finally 'Yes with confidence, and eventually he can tell exactly when and describe what conversation took place Memory at first—like developing memory—is patchy The patient has 'clear or lucid' periods, and he remembers what takes place during those periods It may be possible to recognize the periods that he will remember by such signs as an increase in his alertness, more thoughtful answers, and a more respectful attitude towards the doctor, but I must say that I have sometimes been disappointed later to find that the patient remembered nothing of a period in which it seemed to me that all these signs were present Such periods may at first be of only a minute s duration, and then the patient again answers confusedly, but gradually they become longer

Memory returns as part of the general recovery, but the patient remains amnesic with regard to a period of variable duration preceding the accident

THE RETURN OF ACTIVITY

When the talkative phase has subsided or if it has never been present, the patient s general mental activity, as evidenced by his behaviour, is in most cases low He lies idly in bed or sits about, seldom speaks spontaneously, or if he does he is muttering something to himself about years long past, he takes little interest in what is going on around him, and shows no desire to read or to engage in other forms of mental or physical activity At first he carries out single actions in response to an immediate external stimulus As he improves the effect of an external stimulus is more prolonged, it produces more and more 'affective drive,' it carries him further Part of this improvement may be due to conditioned reactions, but it is apparent where conditioning can hardly be a factor, and the patient performs new activities with less and less urging At a later stage he takes in stupidly something of the content of the picture on the front page of a newspaper that is placed on his bed As the days pass he looks at the pictures with more understanding, but it may be a long time before he reads the headings of the paper with intelligence

When memory returns and he becomes normally orientated, he begins again to talk spontaneously Simultaneously, spontaneous physical activity has been developing It may, however, be years before the patient regains the degree of spontaneous mental and physical activity that he had before his accident, or he may never regain them We shall return to this point in considering "traumatic neurasthenia"

The Emotional State

The patient s emotional state throughout this period of intellectual recovery may go through different phases At first he is irritable, resentful, abusive At a subsequent stage he is often elated and childishly happy This has already been mentioned and I shall refer here only to some of the possible consequences of it. The patient is so pleased with himself and so anxious to be nice to everyone that he would be easily wheedled into making a bad settlement of whatever claim he might have for damages One of my patients told me how a terribly nice gentleman ' had visited him at his home in Sussex and explained to him that the accident (in which he had been knocked down by a lorry) was entirely his own fault, and that he would have no claim for damages at all I do not suggest that any advantage was taken in this instance of the patient s pleasure and simplicity, but the danger is obvious Elation, when it occurs, usually persists in some degree throughout the whole of the patient s illness It has a mitigating effect on some other symptoms, and it seems to prevent the occurrence of an anxiety state such as is common in the later stages of recovery Elation is usually accompanied by a lack of reserve and by some deficiency in the patient s normal respectful behaviour towards the doctor and other strangers with whom he comes into contact If the patient s emotional setting is not that of elation the alternative is depression, querulousness, anxiety, and outbursts of temper

Physiological Nature of the Symptoms

It is evident that the lack of spontaneous speech, lack of intellectual and physical activity, amnesia failure to retain impressions or to appreciate their full significance, represent abolition or severe impairment of function On the other hand, the early irritability and abusiveness and the later elation and talkativeness are in all probability due to release of function—release of functions represented at a cortical level by the abrogation of the higher cortical functions of reserve and thoughtfulness, or what the Romans called 'gravitas The disorientation in place

A pure synthetic Magnesium Trisilicate of the correct chemical composition for the safe and effective control of

Hyperchlorhydria

AND IN

Peptic Ulceration

NOVASORB

An antacid and adsorbent with unique clinical properties

Some of the several advantages of Novasorb are —

(a) The rapid reduction of gastric hyperacidity, the neutralising action gradually slowing down as normal acidity is approached Thus there is little, if any, interference with digestive processes

(*b*) Dosage can be adjusted to maintain a continuous antacid effect

(c) Overdosage cannot cause alkalosis and is not otherwise harmful, unless unreasonable quantities are given for a prolonged period

Dosage —The specific neutralising action of magnesium trisilicate minimises the amount required for full effect as compared with the other antacids The average dose is one teaspoonful This should be modified according to the response

In taking up hydrochloric acid NOVASORB liberates its equivalent of Magnesium chloride and may have therefore a slight aperient effect This is seldom undesirable but a little chalk will correct it if necessary

NOVASORB is issued in :

Bottles of 4-oz	2 6	Bottles of 16-oz.	9
" 8-oz	4 9	" 5-lb	40
Tins of 48 Tablets	2 3		

Evans Sons Lescher & Webb Ltd.

Liverpool and London

patient's environmental conditions—including lack of income and the matter of compensation But in some cases there is another factor which I believe is of greater importance, and that is the difficulty which the patient has, because of his persisting intellectual disturbance, in adapting himself to his normal life, and particularly to his occupation An example will make clear what I mean

A butcher, aged 50, had had a serious accident seven months before I first saw him He said he was unable to attend to his business because whenever he went into his shop he felt awful, and after a few minutes had a feeling that he simply must get away from it He complained also of headaches, depression, inability to concentrate, being easily tired, lack of interest, disinclination to meet people, he found it a great effort to write a letter or to make a simple calculation, and his memory was very bad He had formerly been an active man with a good many interests and many friends, but since the accident had been content to sit about idly, and seemed to have lost all his old interests One of the reasons why he did not want to meet his former friends was that he had nothing to say to them There was thus ample evidence of intellectual impairment persisting from the time of the accident Consider the situation of this man when he goes into his shop His activities there are very largely habits and reactions conditioned over half a lifetime But they require memory, judgement, power of rapid calculation, grasp of details—qualities which he no longer possesses in adequate degree All his strongly ingrained habits and conditioned reactions are frustrated by his persisting mental impairment Is it any wonder that he feels awful and wants to run away after a few minutes? In the case of an employee the conflict is still greater because of the added feeling of compulsion to do the work

It is not surprising, then, if true neurasthenic elements are often superimposed on the picture of persisting psychasthenia In assessing such cases, whether with the neurasthenic element or not, it is important to obtain evidence which will reveal the degree of persisting impairment of the patient's mental activity Fortunately the prognosis is in general good

Other Types

The next largest subgroup is formed of those patients in whom a constitutional tendency towards neurosis of the anxiety type pre-exists and the accident serves to precipitate a period of aggravation They are usually to be distinguished from the last group by their volubility and the multiplicity of their symptoms Their "headaches" are the typical feeling of pressure on the top of the head or of a tight band round the head, and they are not brought on by stooping and by physical effort as are those of patients who are suffering from organic after-effects of head injuries Usually the accident has been of a less severe type than in the cases I discussed earlier, and a history of antecedent symptoms of neurosis may be obtained

Gross hysterical manifestations following injury are, I think, usually the result of pre existing tendencies, and occur in persons of poor mentality Minor degrees of hysteria are possibly common, in the sense that a patient may unconsciously take refuge in a continuance of subjective symptoms rather than make the effort to return to the conditions of his normal life or relinquish a claim to compensation

Then there are those who make the most of their symptoms in an effort to obtain the maximum amount of compensation We scoff at these but we must be careful to recognize that the difficulty of obtaining fair compensation gives rise, especially among the working classes, to a great deal of genuine anxiety

Finally there are cases in which the injury seems to precipitate an attack of depression in a patient whose pre existing mental constitution was of the cyclothymic or manic-depressive type

In referring to these latter groups I have stepped on to the verge of a big subject, with which I hope some other speaker will deal—namely, the influence of the patient's individual mental constitution on the symptoms arising in consequence of a head injury

TREATMENT OF VIRUS DISEASES OF THE SKIN*

BY

R T BRAIN, M.D., F.R.C.P.

Physician in Charge of Skin Departments Royal Free Hospital and the Hospital for Sick Children Great Ormond Street etc

It is a disappointing fact that our knowledge of viruses and the lesions they produce has not added greatly to our therapeutic efficiency in the management of virus diseases of the skin, especially as the most striking examples of lasting immunity occur in certain virus diseases, and few bacterial diseases exist which will bear comparison in this respect with diseases such as measles, mumps, varicella, variola, and zoster The latter impressive examples are apt to obscure the fact that, in general, no essential differences distinguish the immunity following virus from that of bacterial diseases and it appears to be most probable that viruses are living agents having many points of close resemblance to the pathogenic bacteria Similar antibodies are developed in virus diseases, and the presence of these antibodies has been demonstrated by the well-known bacteriological tests of complement fixation, agglutination, precipitation, and neutralization Specific therapy therefore follows the lines of bacteriological procedure, and would chiefly depend upon the use of vaccines and sera

Unfortunately experimental and clinical evidence indicates that in many virus infections specific antibodies are practically ineffective when the virus has once reached a susceptible cell No doubt there are exceptions to this rule, and in 1935 Laidlaw, Smith, Andrewes, and Dunkin demonstrated that an anti-influenza serum had considerable potency therapeutically, even when given to mice two or three days after experimental infection with influenza virus As a rule, however unless specific antibodies reach the cell before the invading virus infection is very likely to ensue, and the use of hyperimmune serum or that of convalescent patients is almost limited to prophylaxis Similarly the induction of active immunity by living or dead vaccine may be very effective in the prevention of infection but of little or no value when infection has occurred

The various means of producing active immunity in virus diseases are

1 Vaccination with living virus
   (*a*) Human strain—for example herpes
   (*b*) Modified by animal passage (vaccinia)
   (*c*) Attenuated by time or temperature (rabies)
   (*d*) Neutralized with immune serum (distemper)

Delax is a bland palatable emulsion of pure liquid paraffin and agar-agar which acts as a mechanical non-habit-forming lubricant, rendering the fæcal mass soft, and promoting comfortable elimination
Particularly suitable for patients suffering from hæmorrhoids and for expectant and nursing mothers

The Boots Chemists

of success with any of these methods has been so small that spontaneous resolution might easily have accounted for the few cures following internal medication No mention has been made of the numerous methods of treating warts by suggestion, and although it is admitted that sometimes the results obtained by such means are very dramatic, no reasonable explanation can be given as to how such influences work in a disease so definitely organic, but if the percentage of success could be ascertained it might compare with the incidence of natural spontaneous disappearance

It is admitted that in some cases nothing short of total destruction of the wart by cautery or CO_2 snow or the removal of the entire lesion by curette will effect a cure

LYMPHANGIOPLASTY—THE FATE OF SILK

BY

HAROLD HARTLEY, M D, F R C S

Consulting Surgeon North Staffordshire Royal Infirmary
Senior Surgeon Burslem Haywood and Tunstall War Memorial Hospital

With a Note by

R A. KEMP HARPER, M B, Ch B, D R

Honorary Radiologist to the above Hospitals

In 1916 I gave an account in this *Journal* of a successful case of lymphangioplasty for brawny oedema of the legs, and wrote "It is said that, whereas lymphangioplasty gives great relief in the brawny arm of cancer of the breast, in lymphatic oedema of the leg its results have not been satisfactory' Recently the patient I described then came to the Haywood Hospital It is hoped that the follow-up of the case, with a few remarks about the theory of lymphangioplasty and the fate of silk buried in the human body, may be of interest

Case Report

As a child, aged 13, in 1901 the patient was scalded on the lower parts of the legs and on the ankles and feet. Healing was very slow and she was unable to stand for six months and then had to learn to walk again From the age of 16 to 21 she had a sedentary occupation as a telephonist At 23 she became a barmaid, but after two years her legs became swollen, heavy and painful and she had to give up her work as it entailed long standing In 1913 after treatment at two of the best provincial hospitals had proved unsuccessful she came under my care

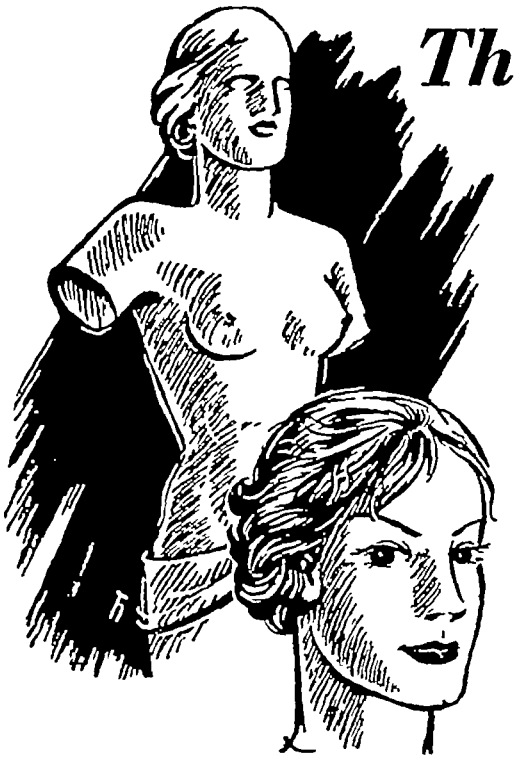
On June 30 1913, lymphangioplasty by Sampson Handley's method using No 12 woven tubular silk was performed on both thighs and legs at the North Staffordshire Infirmary The operation is easy, and special instruments are not required Improvement was slow but continuous and the legs regained their normal shape When next seen in July 1916 she could walk sixteen miles in a day without any swelling of the legs or discomfort The case was shown to the North Staffordshire Medical Society three years after operation

On December 30 1936 she was seen again as an out patient because she had bruised her right ankle and a small ulcer which resulted was not quite healed She is now 49 and can walk miles the legs are shapely and quite normal, except for the scarring left by the scalds The case was shown again to the North Staffordshire Medical Society on December 10 1936

RADIOLOGIST'S REPORT

Dr Kemp Harper reported as follows

'When this patient was x rayed faint opaque linear shadows some fragmented, were seen in the soft tissues in the position where the silk threads were introduced twenty four years ago We decided that calcification had occurred in pieces of silk which still remained unabsorbed after this long interval it was felt however, that some proof of this was required As a biopsy was refused by the patient, experiments were made Long pieces of silk (unimpregnated) were attached to the legs of a subject and films taken, these showed no sign of opaque linear shadows Similar pieces were then soaked in a weak barium sulphate solution and areas of density were seen somewhat similar to those on the original films Silk thread was obtained from the operating theatre of a fairly similar thickness, and this to our surprise was quite uniformly opaque On inquiry we found that the silk had been sterilized in perchloride of mercury and that the opacity of the silk depended on the length of time it had been in the sterilizing solution



As a result of these investigations we feel confident that portions of silk have persisted in the soft tissues for twenty four years, and these pieces, unabsorbed presumably as the result of walling off with dense fibrous tissue, are still visible Two reasons can be advanced for this (1) that the silk or surrounding layer of fibrous tissue has been rendered opaque by the deposition of calcium, or (2) that mercury has remained in the silk unabsorbed for this length of time The latter reason cannot be definitely ruled out as injections of metallic substances into the buttocks in cases of specific disease are often seen on x ray examination of the same region years after such injections have ceased"

Theory of Lymphangioplasty

Brawny oedema is due to lymphatic superadded to venous obstruction A marshy field can be drained by lines of buried porous pipes, but unfortunately a perforated drainage tube buried in the human body becomes blocked by the organization of cellular elements and the coagulation of fluids which have entered its lumen Sampson Handley (1908, 1910) made the brilliant and promising suggestion that silk threads would continue to drain by capillary attraction He showed a section of a silk ligature which had been embedded in the tissues for ten years 'Though eroded at its surface the main substance of the thread is intact Moreover, leucocytes are evidently unable to penetrate between the fibrils of the silk, for the interior of the thread is entirely free from cellular elements Nor is there any microscopical indication of the coagulation of the body fluids in the interstices of the silk' Handley thought the capillary power was retained, but the question arises, Is there an impermeable sheath of fibrous tissue around the silk? This is the crux of the whole matter

Lymphangioplasty was tried, and many early successes in the treatment of the brawny arm of cancer of the breast and in various simple lymphangiomas or oedemas of the arm were reported years ago But Handley himself suspected that the operation would fail in the leg because it could not provide a motor force which would be able to overcome the full pressure of gravity in the lower limb

The operation was tried, chiefly in Cairo (Madden, Ibrahim, and Ferguson, 1912) for elephantiasis of the legs, and always failed The Cairo authorities gave histological details and made experiments, but their cases were not followed up long enough They found that the trauma of the introduction of the silk and the irritation

The health of the woman—

and consequently her vitality, her well-being, her social security—

is shaken by nothing so much as by extensive leucorrhoea—frequently a symptom of serious genito-urinary diseases

In such cases the patient is ever grateful to the doctor who can help her by treatment which is sure and rapid in action, and, since no irrigating apparatus is required, is simple and easy to use

SPUMAN FOAM THERAPY

Spuman therapy, with its approved Spuman combinations, provides a suitable remedy for every type of leucorrhoea.

Survey of Spuman combinations

Spuman c Acid salicyl	Curative cauterisation, reduces inflammation
Spuman c Acid lactic	Physiological adjuvant
Spuman c Argent prot	Gonocidal, anti-catarrhal
Spuman c Argent nitrat	Gonocidal, astringent
Spuman c "Ichthyol"	Antiphlogistic, alleviates pain
Spuman c Zinc sulph	Astringent

This form of treatment is inexpensive as a rule 1 Styli is used once or twice daily

Styli for vaginal, cervical and urethral use are supplied

Vaginal Styli Boxes of 20 Cervical and Urethral Styli Boxes of 18

GRANULOSIS RUBRA NASI IN A MOTHER AND DAUGHTER

BY

F F HELLIER, M.A., M D., M.R C P

Honorary Assistant Physician to the Dermatological Department General Infirmary Leeds Visiting Dermatologist Dewsbury and District General Infirmary

Granulosis rubra nasi is a condition well known to dermatologists but not often recognized by the general practitioner Briefly it is characterized by redness and marked sweating confined to the nose and the surrounding area of the face, with red papules and sometimes numerous small vesicles It occurs most commonly in children, and usually clears up at puberty, but rare cases have been described in adults The aetiology is obscure, though it is clearly a vasomotor disturbance of some sort Many causes have been suggested, from tuberculosis to local sepsis, none of which has been satisfactorily upheld to the exclusion of all others An excellent account was given by Beeson in 1926, this should be consulted for further details

It is probably not so rare as one might think from the English literature, for according to Maschkilleisson and Neradow (1935) over 130 cases had been recorded up to 1932, and they were able to find thirty-three cases in four years in their own clinic This is a remarkable number, but in the dermatological department of the Leeds Infirmary there have been six cases in the last 20,000 patients It is, however, rare to find the disease in successive generations, though less uncommonly it is present in two or more children of the same parents According to Cockayne (1933) only eight instances are known in which there is evidence of the condition being inherited, and it is because the study of genetics demands the accumulation of such instances that I venture to report the following cases

Case I

This patient, a married woman of 43 (Fig 1), has six children four girls and two boys, of whom the second patient is the third girl None of the other children are affected, but the second girl has epileptic fits There is no evidence

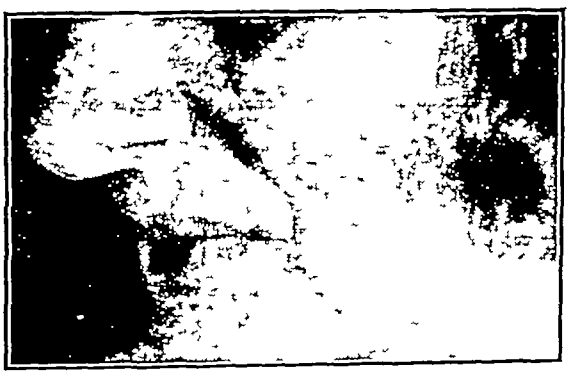

FIG 1—Case I, showing a group of vesicles

of chilblains or any other vasomotor disturbance in the rest of the family The husband has no blood relationship to the patient The woman says that her nose has been red and has been covered in perspiration ever since she was 12 Now, especially after exertion but also without it her whole face over the nose cheeks, and upper lip perspires heavily She has not noticed any abnormal sweating elsewhere her palms etc being normally dry The face does not trouble her at all, except for slight itching at times and she is not worried about the aesthetic appearance Apart from her face she is quite well but she suffers from chilblains on the feet in winter The general circumstances of the family are rather poor there is no history of tuberculosis in the family

Present Condition—At first sight her face suggests rosacea, but closer inspection shows that the lesions on her nose are a group of clear vesicles There are about half a dozen of these, 2 to 3 mm in diameter, situated close to the tip, except one which lies near the naso-labial groove on the right cheek The cheeks are rather highly coloured, and both in the malar region and on the tip of the nose are numerous fine telangiectases Beads of perspiration are present over the nose, cheeks, and upper lip, which on being wiped away soon re-collect.

Case II

Daughter of the above, aged 9 (Fig 2), general health good Since 3 or 4 years old she has had rather a red nose, and it has constantly been covered with beads of sweat. On examination the most striking thing is the intense perspira

FIG 2—Case II nose red but without cysts or telangiectasia

tion, limited to the nose which is also rather red towards the tip, but is not so vivid as the mother's. There are no cysts to be seen, nor has she any telangiectasia She shows no other evidence of vasomotor instability, her palms are dry, and she does not suffer from chilblains.

I wished to treat both these patients by means of x rays but they failed to turn up for treatment and when visited in their own home said that the condition did not trouble them so much as to require further attendance at hospital I think this attitude is to be deprecated, as the condition certainly was somewhat disfiguring, and the little girl ought to have been given the benefit of possible improvement

Comment

The exact mechanism of inheritance in this condition is not quite clear Some families—such as Lebet's cases (1903), a mother and two girls, and Hallopeau's (1906), a father and three children—suggest that the lesion is a simple dominant, but other families do not bear this out Cockayne (1933) explains it as follows "If it is in part dependent on an external factor such as a local infection or a circulating toxin it may be inherited as a simple dominant, but if it is determined solely by a genetic factor the dominance must be incomplete' Apart from this the mother is of interest as representing one of the few cases reported in adults and also in having a cyst on the cheek close to the naso-labial groove

Concealed Inevitable Haemorrhage

The case history recounted below seems to present features sufficiently unusual to merit recording

A primigravida aged 37 years had a smart spontaneous vaginal haemorrhage when at home No pain or discomfort was experienced, the bleeding stopped without treatment after about ten minutes, and no recurrence of the loss took place She was given morphine by her family doctor and was kept in bed for ten days, after which time she was sent to the Princess Mary Maternity Hospital Newcastle

The patient was a spare, sallow complexioned woman who looked older than her actual age The uterine enlargement corresponded with a thirty two weeks pregnancy, and the shape and consistency of the uterus was normal, apart from a firm rounded mass about three inches in diameter which was palpable on its anterior wall below the umbilicus The foetus was presenting by the vertex in the right occipito-anterior position with the head above the pelvic brim, and although the foetal heart was not heard obvious movements could be detected *On vaginal examination no blood was* seen, but a uniformly tense cystic mass, seemingly intra uterine, *filled the pelvis The cervix was thinned and the external os* which was found behind the pubes was closed The urine and blood pressure showed no departure from normal, and radiography demonstrated an apparently normal foetus and a diffuse pelvic opacity

After elimination of extra-uterine swellings four possible diagnoses—namely, cystic fibromyoma with pregnancy, foetal abnormality, localized vesicular mole, and placenta praevia with concealed haemorrhage—were considered Although fibromyomata were present in the anterior uterine wall the tumour was not thought to be a cystic fibroid as the swelling was symmetrical, diffuse, and intra-uterine in position and the rectum as seen on the *x*-ray film was not displaced The presence of foetal abnormality did not offer a likely explanation of the phenomena as the foetal head was presenting and was freely mobile over the mass, and the radiograph showed no skeletal deformity Placental vesicular mole with a developed foetus and placenta praevia was a possible diagnosis, but it was thought that evidence of such a condition would almost certainly have been met at an earlier date The Aschheim-Zondek reaction was reported as ' positive—a good strong reaction The suggestion that the condition might be due to placenta praevia with concealed haemorrhage was felt to give the most attractive explanation of the case but the evidence in favour of this was scanty

Ten days after admission to hospital a large amount of blood clot was passed per vaginam without collapse or fresh haemorrhage The abdominal findings were unchanged, but vaginal investigation revealed that the cervix was now thick, its canal occupied a posterior position and admitted one finger with difficulty, and after expression of blood clot, placental tissue was felt crossing the internal os

Haemorrhage commenced during the examination, and was temporarily controlled by a firmly applied abdominal binder Upper segment Caesarean section was performed about twenty minutes later and a child of 4 lb was delivered in a state of asphyxia pallida from which it did not recover Old blood clot and the placenta were removed from the lower uterine segment, three small fibromyomata were enucleated from the vicinity of the uterine incision and the incisions were sutured A larger posterior fibromyoma related to the pouch of Douglas was left *in situ*

The patient was not unduly upset by the operation convalescence was uneventful and the parietal wound healed satisfactorily

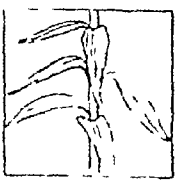
GASTROSCOPY

Gastroscopy The Endoscopic Study of Gastric Pathology By Dr Rudolf Schindler Preface by Dr Walter Lincoln Palmer (Pp 343 illustrated 34s net.) U S.A The University of Chicago Press, London Cambridge University Press 1937



It is fourteen years since Dr Schindler published his *Textbook and Atlas of Gastroscopy* which did a great deal to bring about a revival of interest in gastroscopy in the years immediately after the war The present volume is, fortunately for us, written in English—in a quaint but expressive style Dr Schindler is to be congratulated on having produced a book in such readable English only three years after he left Munich to go to Chicago In an entertaining chapter on the history of gastroscopy he relates how near Glasgow came to being the birthplace of gastroscopy, but the sword-swallower whom Campbell asked to oblige him only replied, " I know I can swallow a sword, but I m —— if I m going to swallow a trumpet '

In the discussion on anatomy it is pointed out that the stomach has, under the conditions of gastroscopy, a shape differing enough from the usual topographical description to make orientation uncertain unless these differences are realized, the most important of all being the torsion of the lesser curvature The chapter on technique is long, and full of advice valuable even for the comparatively experienced gastroscopist, orientation being dealt with in great detail The rapidity with which he insists on the instrument being passed will surprise some English gastroscopists

Dr Schindler s indications for gastroscopy are many He implies that all gastric ulcers should be gastroscoped to determine whether malignant degeneration has occurred, for he believes it can be diagnosed even earlier by gastroscopy than by naked-eye examination after removal of the stomach, when the normal colours, dependent on its blood supply, are destroyed All cases in which a carcinoma is suspected should be examined to determine the diagnosis, and where the presence of a carcinoma has been shown by *x* rays and there is no obvious metastasis, gastroscopy should be carried out to determine the degree of intragastric spread and the question of operability In the majority of cases he claims that he can save a purely exploratory operation Here the not infrequent occurrence of a removable carcinoma with hepatic secondaries is ignored In duodenal ulcer the gastroscope may show any additional gastric ulcer or gastritis, and often the presence of haemorrhagic spots, some of which may have progressed to erosions or retrogressed to pigment spots This finding may have some bearing on both aetiology and prognosis Cases of gastro intestinal bleeding should be examined, particularly as the cause is either not shown at all or only inadequately by *x* rays, and the same applies to that large group of patients so frequently labelled as ' bowel distress " or " gastro intestinal neurosis," in which a more or less severe gastritis is often the cause of the symptoms Among the other indications are unexplained loss of weight or appetite, and unexplained vertigo, certain chronic dermatoses and urticaria, and dyspepsia in syphilitics

The diagnosis of chronic gastritis is the main justification for gastroscopy and Dr Schindler sets forth his views on the classification and diagnosis of the various types of gastritis clearly and dogmatically His clinical data and acumen are considerable, but what we miss is a

SUPREME QUALITY IS BURROUGHS WELLCOME QUALITY

The second part of the book deals with treatment, and rightly occupies the greater part of the volume Numerous useful hints are given as to the prescribing of a reducing diet which will function slowly but effectively, rather than those which reduce weight with great speed but which produce a feeling of extreme exhaustion and hunger in the victim The difficulty is that with these diets which work but slowly, removing a pound or two a week, it demands more will-power of the patient than is usually forthcoming Most people desire rapid reduction of weight, if only from the point of view of settling once and for all the question of an entirely new wardrobe, and the prolonged effort to keep a check on food intake is more than many can endure Although brief reference is made to a tendency to water retention in some cases of obesity, the matter might be elaborated with advantage in later editions All those with experience of these cases realize that, though the vast majority of patients can be reduced in weight by means of dieting alone, every now and then a case appears which is absolutely resistant to virtual starvation It is in these that one often finds a strong tendency to water and salt retention, and the use of some of the modern mercurial organic diuretics, associated with limited fluid intake and salt restriction, may act as a charm

Details of muscular exercise are not given, but Dr Christie wisely refers the matter to Mr Hornibrook s book entitled *The Culture of the Abdomen* which has been responsible for the restoration of waistline and bowel function in so many thousands of individuals during the last few years The book is unquestionably good and thoroughly practical, and will be welcomed by general practitioner and consultant alike

SPONDYLOLISTHESIS

La Spondylolyse et ses Conséquences Spondylolisthésis Scoliose Listhésique By Pierre Glorieux and Carle Roederer (Pp 208, 138 figures 60 fr) Paris Masson et Cie 1937

In publishing this treatise upon spondylolysis and its consequences spondylolisthesis and listhetic scoliosis, the authors have done a valuable service in giving a careful review of the very large literature that is growing up upon the subject more generally known as spondylolisthesis' This lesion used to be considered a rarity of interest to the obstetrician only as a cause of difficult labour, but now increasingly recognized as a very common and important factor in many cases of low back pain and sciatica in either sex

In the present work the congenital nature of the basic lesion of the posterior neural arch is discussed, with the effect of static influences and trauma in causing displacement of the two portions of the vertebra Scant justice is done to the very reasonable theories of the mechanics of spondylolisthesis put forward by Capener and other English writers, and in their place is substituted a plausible but even more questionable hypothesis Upon the radiology of spondylolysis the authors are to be congratulated upon a most painstaking investigation and a series of very clear demonstrations of the pre-slip stage They stress the importance of radiography of the lumbo-sacral region in the erect posture for in this position infractions of the laminae of the fifth lumbar vertebra may be seen which cannot be demonstrated in recumbency It surprises us that more use is not made of this position for spinal radiography by those having much to do with static disorders of the spine

Concerning treatment the authors have little new to offer, they stress the need for conservatism in the earlier stages and reserve operation for those cases in which pain persists or in which there is evidence of continued sliding of the lumbar spine forwards upon the sacrum This latter circumstance is not infrequently mentioned by writers upon spondylolisthesis, but it is worth noting that no very satisfactory series of radiographs appear yet to have been published showing the various stages of displacement in any single case Glorieux and Roederer rightly question the anterior bone graft procedure, and give a good account of other operative possibilities besides the well-known Albee or Hibbs type of posterior osteosynthesis Of particular note is the use of lumbo-iliac grafts thus copying the natural arrest of spondylolisthesis by ossification in the ilio lumbar ligaments Posterior bone grafting is, however, regarded as the easiest technically and very satisfactory in its results The book concludes with a short chapter on the medico legal aspects and a bibliography of 300 references

INFANT HYGIENE

Infants in Health and Sickness By Robert Ellsworth Steen M D F R C P I (Pp 127 illustrated 5s) London Humphrey Milford, Oxford University Press 1937

Dr R E Steen, who contributed the section on care of the infant to the recent edition of Tweedy s *Practical Obstetrics* has now republished this as a separate volume with a few minor additions under the title *Infants in Health and Sickness* The main portions of the book are concerned with feeding the normal baby and the principal disturbances of the digestive system Breast feeding and its management are well described, and the methods advocated when natural feeding fails are in accordance with modern views, the milk mixtures recommended being considerably stronger than those allowed under certain still popular but out-of-date systems, such as that of percentage feeding, which is severely criticized Diseases of the neo natal period are well described, as might be expected in view of the origin of the book Dr L B Somerville-Large contributes a useful chapter on ophthalmia neonatorum, and an appendix contains a valuable collection of diet sheets, which appear to be modified from those in use at the Hospital for Sick Children, Great Ormond Street, London Dr Steen must be congratulated on the way in which he presents his matter, and practitioners requiring a thoroughly practical manual on the care of the infant can be advised to buy this modestly priced volume

Notes on Books

An Atlas of Gas Poisoning was published for official circulation only, in 1918 by the Medical Research Committee, which was the precursor of the present Medical Research Council The Air Precautions Department of the Home Office has now issued a second edition of this atlas, which is to be sold at the very low price of 1s The atlas consists of 11 excellent coloured plates with 16 pages of descriptive text These plates show the typical lesions produced by phosgene and by mustard gas A large proportion of members of the medical profession have no first-hand knowledge of gas poisoning, and this atlas provides a very easy means of learning the essential pathology of two important types It should be found particularly valuable by those engaged in training personnel in the treatment of gas casualties

Professor A LEMIERRE s little work entitled *Certain Primary Truths on Infectious Diseases* (Paris, Masson et Cie, 24 francs), which forms the latest addition to the

MENTAL SYMPTOMS ASSOCIATED WITH HEAD INJURY

THE PSYCHIATRIC ASPECT*

BY

EDWARD MAPOTHER, M.D., F.R.C.P.

Professor of Psychiatry, University of London; Medical Superintendent, Maudsley Hospital

My contribution towards discussion of the problem in question is limited to two of its aspects—namely incidence and prognosis. No general conclusion on these points could be reached except by working forward—that is, by systematic and unselected consideration of after history in a large number of cases. The necessary facts could best be collected by one or more general hospitals that are called on to deal with many such accidents. A standard mode of examination, probably including such investigations as a radiograph of the skull and cerebrospinal fluid analysis, would have to be adhered to regardless of the needs of the particular case. It would be necessary that a full history of recent and remote experiences and mental tendencies should be obtained shortly after onset, and that subsequent regular notes should record at the time any changes that occurred. In the absence of such data it is clearly impossible to reach general conclusions as to incidence by working backwards from cases that eventually are seen by the neurologist or psychiatrist, since these are only the cases in which serious sequels have followed, and the psychiatrist sees in proportion more of the serious mental sequels while the neurologist sees more of the slight. Moreover, in the case of the psychiatrist there is for various reasons a tendency for him to see after accident a higher proportion of those who before it already had some mental symptoms than of those who had been perfectly normal.

Bearing in mind all these sources of error, and realizing that it is at present impossible to estimate total incidence, it yet seems worth while to consider the relation to head injury of the very numerous varieties of mental abnormality that may follow, their respective frequencies, and time relations, the connexion of these with one another, and finally the course which different varieties are prone to take. Before going further certain distinctions and definitions are necessary.

1. The relation of a mental abnormality to head injury may be physiogenic or psychogenic. The minimum evidence of physiogenic causation is the presence of retrograde amnesia.

2. Whatever the type of causation one can consider cases either in broad outline or in detail. (*a*) One can concentrate upon syndromes—that is, upon the effect of the injury on structures subserving functions which are innate and common to us all, and so upon structures which may probably be known fairly soon; or (*b*) one can study the effect upon connexions of a kind that are acquired and peculiar to the patient, and so disturbance of functions in a way that for a very long time will only be expressible in psychological terms and these of an individual kind.

* Read in opening a discussion in the Section of Neurology and Psychological Medicine at the Annual Meeting of the British Medical Association, Belfast, 1937.

I propose here to deal mainly with effects that are physiogenic and expressible approximately in terms of syndromes.

The psychiatrist is principally concerned with those mental sequels that follow recovery of consciousness. In my opinion the only practicable criterion of recovery of consciousness is awareness of external environment and accessibility. It is true that this often makes it impossible to ascertain the duration of unconsciousness as whether the skull was fractured. But the obtaining of a statement uniformly from all patients is dearly bought by a convention which makes that statement mean something *quite different in various cases. Such is the inevitable* result of identifying the duration of unconsciousness with the period which the patient subsequently cannot remember: this period may correspond to one or more of about eight different varieties of amnesia that follow head injury.

For present purposes I wish to classify as psychotic all mental abnormalities after recovery of consciousness into the character of which the patient at the time lacks insight and which if sufficiently prolonged would have justified certification. The term neurotic implies the contrary in respect of each of the two points. I shall deal largely though not exclusively with psychotic sequels.

Returning to the problem of the relations of various forms of mental disorder to head injury and their prognosis, I propose to attack this in two ways: (1) by discussion of published evidence of various authorities; (2) by consideration of hitherto unpublished data which I have collected from a number of sources.

1. Published Evidence

There are no national statistics in England and Wales that indicate the influence of head injury in causing mental disorder. The number of motor casualties has steadily risen until it has reached nearly 6,000 deaths and over 200,000 injured per annum. It may be that in these days of universal third party insurance the tendency to reckon oneself a casualty has increased, but it would probably be safe to assume that incidence of serious head injury with survival must be rising about as fast as deaths from motor accidents. The statistics of the Board of Control concerning admissions to mental hospitals reveal no trace of this. They show admissions attributed to injury as stationary in absolute number and as forming a declining proportion of the total number. This result is due to the fact that they not only fail to discriminate as to severity of injury but also fail to distinguish between injury to the head and to the rest of the body.

THE STATE OF THE PUBLIC HEALTH

CHIEF MEDICAL OFFICER'S REPORT *

[SECOND NOTICE]

A summary of the earlier chapters of Sir Arthur MacNalty's annual report for 1936 as Chief Medical Officer to the Ministry of Health appeared last week at page 1033

Tuberculosis in 1936

There were 28,268 deaths from tuberculosis in England and Wales in 1936—933 fewer than in 1935 The figures for both respiratory and non-respiratory tuberculosis are the lowest ever recorded There has indeed been a considerable decline in the mortality from respiratory tuberculosis during the past five years During the year 55,128 new cases of tuberculosis were notified in England, as compared with 55,418 in 1935 The number of cases dealt with by tuberculosis officers for the first time was 94,313, against 89,457 in 1935 In view of the steady decline in the incidence of the disease these last figures probably indicate that greater use is being made of the service for suspected cases There was an increase of 24 per cent in the use of *x*-ray examination in the diagnosis and control of dispensary cases, and the great improvement in the personnel of the service noted in Sir Arthur MacNalty's last annual report has continued Increasing importance is attached to the examination of contacts, it is among these that undiscovered cases of pulmonary tuberculosis are most likely to occur It is also worthy of note that a relatively larger use is made of beds for observational purposes This section of the report discusses the unsettled question whether there is or is not an abnormal prevalence of tuberculosis among nurses who attend upon tuberculosis patients

Venereal Diseases

Facts are given which appear to justify the conclusion that the measures taken under the Venereal Diseases Regulations are lowering the incidence of fresh infections with syphilis in this country and lessening the transmission of the disease to the next generation There was a slight increase in 1936 in the number of cases of gonorrhoea dealt with for the first time, but it does not follow from this that there has been an increase in the incidence of the disease Probably the treatment centres in this country are not yet attracting a sufficient proportion of members of the community infected with gonorrhoea, especially in the case of women During the year 735,554 pathological specimens were examined in the approved laboratories and centres, an increase of 23,148 over 1935

The Cancer Problem

There is still no indication of any decline in cancer mortality, indeed, the crude mortality figures again show an increase for the year under review, and, moreover, a greater one than in 1935 The certified deaths for both sexes numbered 66,354 for 1936 against 64,507 for 1935, an increase of 1,847 As pointed out in previous annual reports, there are reasons for believing that the recorded increases in mortality do not necessarily connote an augmentation of general causational factors, but the rising rates add to the difficulty of the administrative problem of providing adequate means for diagnosis and treatment Investigation into the causation of cancer proceeds, however, with increased zeal in two main directions with promising results—namely, the action of carcinogenic substances and that initiated by the discovery of virus tumours in fowls With our present knowledge, preventive measures are almost limited to modifying certain environmental conditions arising in a few occupations and to surgical treatment in the individual conditions predisposing to cancer As regards curative treatment the chief hope lies in earlier diagnosis, which enables earlier treatment to be undertaken with greater promise of lasting cure Adequate treatment means, however, not only earlier diagnosis but adequate facilities for treatment by operative surgery, radium, and x rays A careful investigation shows that these facilities, especially as regards radiation treatment, though increasing, are as yet by no means sufficient Suggestions are made whereby modern methods of diagnosis and treatment might be placed at the disposal of a larger section of the population

Relation of Food to Health and Disease

Investigations on nutrition problems were actively pursued The Advisory Committee on Nutrition, in addition to its memorandum *The Nutritive Value of Milk* has made progress in other directions—for example, the amounts of different foods required for correct nutrition, and cognate matters The League of Nations has also devoted much consideration to the subject, and has published the result of its inquiries in four important volumes In respect of investigations on nutrition which were initiated by and have been done under the supervision of the Ministry, studies have been made on the diets of sixty-nine working class families in Newcastle on Tyne and another study of the same type in the West Riding of Yorkshire on the growth rate of infants, on physiological tests of physical efficiency, and on the condition of the blood in expectant and nursing mothers Investigations have also been made on the diets in public assistance institutions, and suggestions have been made with a view to improving them The recent development manifested in the establishment of milk bars also receives notice, and the conclusion is drawn that if "operated on the proper lines their introduction is undoubtedly of advantage to the community in fostering the consumption of one of the most nutritionally valuable foods we possess The necessity for pasteurization is emphasized Evidence is accumulating that 'there is no significant difference in nutritive value between raw and pasteurized milk" In 1936 food poisoning outbreaks were much fewer than in 1935, the number about which the Medical Department obtained information being eighty-two, as contrasted with 137

Medical Intelligence and Research

A list is given of nearly sixty committees on public health and medical questions on which members of the Ministry's staff have served, without counting committees and subcommittees of the Medical Research Council Eighteen reports and memoranda of special medical interest were issued during the year Research in medical statistics is shown to have revealed such matters as that, in schools, the largest factor of lost time is disease of the respiratory organs especially the common cold and influenza, and that generally speaking the rates of mortality in the group of depressed areas have improved "at the same rate as or even a little faster than those of England and Wales as a whole' But the general results also showed a very great contrast between the death rates in various areas, and there is no ground for relaxation of effort

Two features of this section of the report are those dealing with new drugs of the so called "prontosil" group, and some of the dangers attaching to the use of lipstick, certain classes of hair dyes and some modern "slimming' remedies Other matters dealt with range from a discussion on diphtheria prophylactics and water supplies to the "disinsectization' of aircraft and the therapeutic use of snake venom Full particulars follow of port health administration during the year, and of international health work In connexion with the former an account is given of the remarkable outbreak of yellow fever on board the s s *Sea Rambler* The remainder of the report consists of statistical and other appendices Among these may be mentioned Appendix A,-devoted to investigations of streptococci, and Appendix B, which deals with thrombo angiitis obliterans and the alleged relation of this disease to smoking

* *On the State of the Public Health* Annual Report of the Chief Medical Officer of the Ministry of Health for 1936 H.M Stationery Office (4s net.)

(iv) Many patients who would be in a mental hospital if suffering from identical symptoms of non traumatic origin are neither certified nor in any institution if the psychosis be due to head injury of either military or civil causation Both in peace and in war cases compensation is generally available that makes it possible to keep the patients uncertified at home This is shown by the high proportion of very chronic helpless or troublesome patients among those actually sent

With regard to the special question of whether a post traumatic schizophrenia exists and the incidence of this two points should be noted

(A) Refusal to recognize existence of this is often due to an outworn conception of schizophrenia as being not a mere syndrome but a disease of constant and specific aetiology Under the influence of this conception we get argument in a circle The name schizophrenia is withheld from traumatic cases to which it would be applied if a history of injury were absent Naturally we shall find little schizophrenia as a sequel of head injury if to those cases that might be thus named we apply the so-called diagnosis insanity with gross brain lesion"

(B) Even if as a general principle the occurrence of schizophrenia with causal relation to head injury is recognized it is easy in the individual cases unduly to minimize the responsibility of trauma by overemphasizing trifling indications that may be seen as precursors of schizophrenia but are also common in those who never develop it A case for dismissing most actual instances as idiopathic rather than traumatic can be bolstered up by use of such evidence

The whole situation becomes analogous to that of epilepsy once it is grasped that like epilepsy schizophrenia is the name of a syndrome and that the idiopathic variety is merely the commonest among many We see that after head injury schizophrenia may like epilepsy appear early and may then be transient or may persist It may occur later with an interval of normality While responsibility of trauma for fits is recognized although these first occur after an interval of years I should not for the present suggest such recognition in the case of schizophrenia appearing after an interval of more than a few months Thus the evidence of connexion is much stronger in cases of traumatic schizophrenia hereafter cited than is usually required for diagnosis of traumatic epilepsy

2 Evidence from Hitherto Unpublished Data

Personally I have always found it difficult to reconcile statements made by pensions officials of various countries concerning absence of causal relation between head injury and mental disorder with one's clinical experience showing the immediacy of sequence Thus it has seemed worth while in respect of civilian cases to try and frame some statistics that are based upon either personal knowledge of the patients or at least upon a detailed study of the clinical records made by psychiatrists in charge of the cases One difficulty which arises is that the impression which any psychiatrist would get regarding the incidence nature and outlook of traumatic mental disorder would vary enormously according to the conditions under which he practised I have therefore thought it might be useful to collate (i) All instances among a series of 5 000 psychiatric cases seen consecutively in private practice in which serious head injury and definite mental disorder coexisted and in which there appeared to be a clear causal relation between them (ii) All similar instances from each variety of L C C institution at which may be treated any sequels of head injury that come under a psychiatrist at all

The collation of the statistics from various types of L C C institution has involved preliminary examination of over 30 000 case records I have to express thanks to the medical superintendents of twelve institutions for granting access to these records and at the same time to the medical staff and social workers for all the trouble they have taken in searching for relevant cases It is hoped that others may be able from special standpoints to make a more adequate analysis of the cases so extracted

CASES SEEN IN PRIVATE PRACTICE

There were 123 cases in which mental disorder was said to be present and was attributed to an alleged head injury among 5 000 consecutive patients seen privately However forty three of these 123 patients were seen for medico legal purposes and only eighty for purely medical reasons This situation contributed to the fact that of the 123 the relation was truly causal in ninety two but not so in thirty one Disregarding the latter the proportion of cases in which mental disorder and head injury were causally related among all those seen privately works out at 18 per 1 000

The group of thirty one cases were excluded from the eventual comparison with other groups derived from various municipal institutions (which had been similarly weeded) In all such groups there might be a tendency towards inclusion of too many cases as illustrating correlation of mental disorder with head injury One needs constantly to check this tendency which results from several causes First the distortion of history to which relatives are prone The temptation in idiopathic cases to find some event that can be held responsible is almost irresistible Attribution to injury is to most relatives more agreeable than admitting mental disorder to be constitutional and perhaps hereditary In medico legal cases of course there is an added incentive for distortion—a hope of pension or of damages for injury sustained during employment or in a road accident

Among the thirty one excluded cases were many presenting difficult and interesting problems of aetiology Some details will illustrate the similar sort of weeding that had to be done in respect also of the groups from L C C institutions

31 Cases in which Mental Disorder was Said to be Present and was Attributed to Alleged Head Injury but which were Excluded as not having True Causal Relation

(*a*) Organic disease with mental incapacity existing before accident (whether unchanged or aggravated by it)

Epilepsy 2 general paralysis 1 post-encephalitic Parkinsonism 1 arteriosclerosis 3 meningovascular neurosyphilis 1

(*b*) Mental disorder without well-defined physical disease existing before accident (whether unchanged or aggravated by it)

(i) Injury unconnected amentia 1 schizophrenia and paraphrenia 4
(ii) Injury suicidal and due to prior psychosis 3
(iii) Injury due to alcoholism 3

(*c*) Mental disorder developed after injury but independently of it (as shown by long interval)

Idiopathic schizophrenia 4 idiopathic epilepsy 1

(*d*) Malingering 7

CASES TREATED AT VARIOUS L C C INSTITUTIONS

1 During the five years 1932 to 1936 inclusive there were 12 000 admissions to the seven London County mental hospitals receiving the certifiably insane from London south of the Thames and thus serving a population of some two millions Of these 12 000, mental disorder was causally related to head injury in thirty three —that is approximately in 3 per 1,000 admissions This group contained a large proportion of very late cases and those of bad prognosis and often difficult to nurse—for

pulmonary tuberculosis has proved that tomography can help to open up the jungle of the "radiographic hilum" When it has come into routine employment we may expect to hear less and less of "thickened roots" and more and more of pathological facts, precisely stated

Although the main interest has up to the present been directed to tomography of the chest, it is becoming clear that it has much to offer in skeletal radiography It may solve two types of problem familiar to all radiologists The first is that of a bone of low density and delicate structure, hidden by denser structures common examples are the sternum, patella, zygoma, sternoclavicular joints, atlas and axis, temporomandibular joints, hyoid bone, thyroid cartilages, and many others, which at present require special techniques involving oblique incidence of the rays, with consequent distortion The second type of problem is that concerned with regions in which there is a multitude of overlapping structures, as in the skull and spine It is not possible to consider here in detail how valuable tomography is proving itself to be in such cases Twining [10 11 11] has given examples of its value in radiography of the skull, sinuses, and spine, and in ventriculography Janker[8] has applied it to the study of the spine and long bones, to the differential diagnosis of sarcoma from simple disease of bone, and to other conditions of orthopaedic interest He has also employed it in ventriculography,[15] and considers that it may be of real aid in the localization of brain tumour It would be absurd to allege that tomography in its present form can replace the older methods, especially stereoscopy, but in conjunction with them it has much to offer The great need at the moment is for the apparatus to be available at a reasonable cost for routine work Only in this way can the indications for tomography be learned and its many possibilities exploited It has been shown by Twining[11] in this country, and later by Colyer (at a demonstration at the British Institute of Radiology, May, 1937), that tomography can be carried out efficiently with simple and inexpensive attachments to standard apparatus for radiography We believe that this lead will shortly bring about the development by manufacturers of such attachments Most publications have dealt with work carried out with the excellent pioneer apparatus of German firms, which is somewhat expensive Given the necessary increase in facilities it can hardly be doubted that in a few years all radiological departments will employ tomography as a routine measure, much as they now use stereoscopy, not, of course in every case but for particular purposes which it alone can fulfil

DANGERS OF "SLIMMING"

Sir Arthur MacNalty, in his annual report as Chief Medical Officer of the Ministry of Health for 1936 (of which our summary concludes this week at p 1074), makes some pointed remarks on the danger of taking drugs for "slimming" except on medical advice He thinks that one drug, dinitrophenol, should not be taken in any circumstances, for medical literature is strewn with records of disasters from its use Nor have these disasters always been due to overdose or carelessness The fatalities have not been few, and, short of that, grave disabilities and impairment of health have resulted Among the more serious evils which have followed in the train of this noxious drug are cataract, agranulocytosis, exfoliative dermatitis, and toxic jaundice Moreover, there is no known antidote nor can the measure of susceptibility to it be estimated Sir Arthur rightly concludes that it would be well if its existence were forgotten

But this is only an extreme instance of the harm which is being done by the slimming cult Haphazard and light-hearted use of thyroid extract for weight reduction is another This can only bring discredit on a drug which when suitably administered is of the highest value if hypothyroidism is present Otherwise its general effect may be described as the dehydration of fats—a process which is complete within ten days—and an increase in the basal metabolic rate Now this rate is by no means always subnormal in obesity, and may even be higher than normal In such circumstances the use of thyroid may be followed by tachycardia, glycosuria, and other signs of hyperthyroidism Moreover, it is often overlooked even by the medical profession, that the new scale of doses in terms of thyroideum siccum is about five times as strong as the old scale in terms of the fresh extract Naturally, serious results have followed an unintentional change from the old scale to the new There is another aspect of this question Professor E C Dodds, quoting Murray Lyon and Dunlop to the effect that 9 grains of thyroid extract are required to produce a loss of weight equal to that produced by a standard 1,000 calorie diet, has pointed out that it would be dangerous to use thyroid extract in the treatment of obesity in a person who is over eating and therefore might easily be taking 5,000 calories a day, and if even 18 grains of thyroid were given the total energy balance would still exceed requirements, so that the individual would not appreciably lose weight But we should not agree with him that every case of obesity can be cured by diet alone, if thereby he implies that this can be done without disturbance of health During the food restric-

at the same time since to this applies most of what is to be said

In determining any of these syndromes the physical effect of the injury is of *minimal importance*—as witness the fact that they often occur in cases with no retrograde amnesia at all The important factors are (i) the purely emotional shock experienced at the time of the accident or subsequent distress caused by any impairment of the patient's bodily condition or external circumstances (ii) the constitution at the time of accident—that is the resultant of inborn tendencies and the evolution of these which has been determined by age physiological epochs and any prior experience (mental or physical)

Minor degrees of affective disturbance (and minor paranoid reactions) may follow head injury in virtue mainly of the first group of factors or at least of these coupled with minor constitutional abnormalities Affective and paranoid developments of psychotic severity after trauma occur almost exclusively in those with evidence of major neuropathic tendency (previous attacks persistent abnormality of some degree or strong family history) This is indicated by Table II in respect of major affective cases

Hysteria—This term is used here in a strictly limited sense—the representation or exaggeration of some incapacity (whether physical or mental) motivated by desire to obtain pleasure or reduce displeasure with incomplete knowledge of the motive or intention for representation or exaggeration If knowledge is complete then the condition is malingering if such insight is totally and permanently lacking then we are dealing with a psychotic condition which should hardly be called hysteria The transition from one to other category may be entirely continuous in different cases or in the same one

Hysteria as a factor of any degree whatever in post-traumatic mental syndrome is far less frequent than used to be thought, and as the whole mental picture it is still less common It was present in thirteen out of my series of ninety two cases but in four at least of these it was combined with either physiogenic disability or with affective *disturbance that was not motivated Even that gives an* unduly high idea of its prevalence owing to the large proportion of medico legal cases in my series

It is a gross mistake to look only to financial motives for hysteria even in compensation cases as shown by one case in a mental hospital where the whole mental syndrome was hysteria following head injury Even when money is the main motive those of us most conscious of our own rectitude need not be entirely scornful The patient with any physiogenic disability often regards the capitalization of it at the highest figure as being a duty to his family and his sole chance of doing anything for them and is usually prompted by his wife

Mental Syndromes having Physiogenic Relation to Head Injury

Physiogenic syndromes appear to fall into two classes

(A) Disorder of specialized mental functions probably associated with damage to particular neuronic patterns and so perhaps with lesions of focal distribution—This class includes cortical impairments of perception and of voluntary movement agnosias and apraxias of various types sensory and motor aphasias Also in my opinion Korsakoff's syndrome demoralization epileptoid mental paroxysms

(B) More generalized types of mental disturbance, probably associated with diffuse impairment at one of a series of cortical levels

I should incline to suggest that the universal sequence of stages during recovery in a very severe case is as follows (1) Coma (2) Confusional states with (*a*) stupor (*b*) active delirium (3) Schizoid states with (*a*) schizoid stupor (*b*) schizoid activities (4) Psychasthenic states with (*a*) depersonalization and derealization (*b*) obsessional thought feeling and action

A SPECIALIZED PHYSIOGENIC SYNDROMES FOLLOWING HEAD INJURY

As stated these may include (i) cortical impairments of perception and voluntary movements agnosias and apraxias sensory and motor aphasias (ii) Korsakoff's psychosis demoralization and epileptoid mental paroxysms I do not intend here to say more about the items of subgroup (i) but something about those of subgroup (ii)

Korsakoff's Syndrome—This has been regarded by Symonds as one of the universal stages in the process of recovery from any mental impairment by head injury which goes as far as loss of consciousness I should be loath to agree on theoretical grounds if at any stage in the universal process of recovery mental disturbance were limited to that extremely specialized incapacity to which this distinctive name can most usefully be restricted then the fact would seem destructive of an illuminating generalization which Symonds himself has expounded Clinical fact of course and not theoretical preconceptions must decide But I have not found fact as suggested

Demoralization of every kind is another occasional sequel which is apt to become apparent after an interval By demoralization is meant habitual disregard coupled with consciousness of the anti social character of one's acts in pursuit of pleasure or avoidance of displeasure There were nineteen cases among all the psychotic cases which I investigated—including six among my own It is most common by far among children and among adults I think it was commoner in soldiers and for the same reasons that produced a wave of criminality as an aftermath of war It is not confined to those who have been morally below par before the accident Though usually a psychogenic element is traceable in determination of the condition it cannot be wholly explained thus It may be an almost isolated anomaly or may be associated with widespread deterioration of various kinds and degrees

Epileptoid Mental Paroxysms—What are popularly called brain storms usually include violence They may be associated with persistent demoralization or with a schizophrenic state or with liability to motor convulsions But they may also occur in post-traumatic patients who for most of the time are decent citizens They were relatively common among those who had a head wound in war and are specially liable to be precipitated by a small amount of drink

B GENERALIZED MENTAL DISTURBANCES

Certain principles emphasized by Dr Symonds concerning these appear in essence to be not only true but to exemplify conceptions of great importance these conceptions have a much wider significance in psychiatry than their particular application to post traumatic mental syndromes The objective facts are as follows

In respect of these syndromes a constant sequence can be recognized According to the severity of general disturbance to the brain impairment proceeds as far as one of a definite series of syndromes of which the most extreme is coma In the course of recovery these syndromes can be recognized as a series of stages and recovery necessarily proceeds in regular order from one to another of them

ory, and Spain The number of addicts reported in 1935 was in Egypt 16 957, in Japan 2 800, in the United Kingdom 700, in Italy 427, in Poland 378, in Turkey 144, in the Netherlands 41 In the United States it is claimed that "the total number of non-medical addicts has decreased and that there is now less than one addict known to the authorities per 1 000 of the population" The area under poppy cultivation in China is estimated to be about 109,654 hectares, in British India 3,346 hectares, in Turkey 25,417 hectares, in Soviet Russia 10,024 hectares in Iran 18,860 hectares, in Japan 1,502 hectares, and in Korea 2,481 hectares Four countries furnish information as to the revenue derived from opium The total revenue of the Central and Provincial Governments of India derived from excise duties and licence fees in 1935 was 23,092,305 rupees (26,325,228 gold francs) In Iran the budget estimates for revenue derived from the opium monopoly in 1935 were 75,000 000 rials (14,250,000 gold francs) In Korea the opium revenue in 1935 was 433,786 yen (390 407 gold francs) In the Union of Soviet Socialist Republics the income of opium cultivators was 3,200,000 roubles in 1935 The participation of sovereign States in the three Opium Conventions of 1912, 1925, and 1931 is reported as follows Forty-five States are parties to all three conventions, seventeen are parties to only two conventions, six to one, and three to none

THE PROBLEM OF LEISURE

Under the auspices of the National Institute of Industrial Psychology and the British Institute of Adult Education a conference on this subject was held at Queen Mary Hall London, on November 18 The audience, which numbered more than 500, included representatives of over 200 organizations concerned with recreational and educational facilities Sir Wyndham Deedes, who presided, read appreciative messages from the Duke of Kent, the Archbishop of Canterbury Viscount Sankey, and Sir John Reith The time had come he said, for some scientific approach to the subject It was significant that such a great gathering should assemble to discuss how the people might more usefully spend their leisure time The whole question of leisure was intimately connected with the questions of sound and healthy bodies, and it was significant that, on a computation made by the British Medical Association, 40 per cent of our population needed and did not get the right kind of physical recreation The special aspect of the problem before the meeting was a proposal to make a survey in representative districts of the facilities for leisure occupations and the extent to which they were used This proposal was outlined by Captain Blaksley of the National Institute of Industrial Psychology who said that last summer, when the Institute decided to turn its attention to the problems of leisure as well as to those of work, he found a marked consensus of opinion that the matter should be taken up promptly While a good deal of useful information had been collected concerning particular groups nothing had been published which could be called national in its handling of the problem The proposed inquiry would serve two purposes it would provide practical guidance for those concerned with leisure pursuits, and it would educate public opinion in the opportunities for profiting by increased leisure time A committee to supervise the inquiry was already in process of formation Mr R S Lambert of the British Institute of Adult Education followed with references to the serious degree of apathy among large sections of the public towards the facilities available for the beneficial use of leisure After discussion, in which Mr Osborn (Garden Cities and Town Planning Association), Mr Holdsworth (National Cyclists Union), Dr Rutland (London Council of Social Service), Dr Leon Zeitlin, and others took part, a resolution was carried unanimously, welcoming the proposed inquiry and report as a step of practical value

THE DISEASE OF SWINEHERDS

From work recently reported by Dr Paul Durand and his colleagues[1] it seems as if yet another addition will have to be made to the already lengthy list of diseases communicable from animals to man As long ago as 1914 Henri Bouchet, a country doctor in Haute-Savoie, observed a peculiar disease in swineherds, to which he gave the name "pseudo-typhoid meningitis" Other workers have encountered the same disease in Switzerland and Italy and have called it by a variety of names The present authors give a careful clinical account of the disease and describe its successful transmission under experimental conditions to human beings After an incubation period of two to four weeks the natural disease commences with fever headache, and severe muscular pains Digestive troubles appear—foul breath, green vomit, abundant fetid diarrhoea, meteorism, and sometimes rectal haemorrhage After about four days of this preliminary typhoid state the temperature falls nearly to normal, and the patient may attempt to resume work In a couple of days, however, it rises again and meningeal symptoms appear The cerebrospinal fluid is under considerable pressure and the lymphocytes usually number several hundred per c mm Examination of the blood reveals a polymorphonuclear leucocytosis After three or four days the meningeal phase comes to an end and the fever falls by crisis or lysis In some cases a non-haemorrhagic macular or maculopapular rash appears on the abdomen and inner aspect of the thighs just before the remission Conjunctivitis is not uncommon during the typhoid phase The disease is practically never fatal, and leaves behind it a fairly solid immunity Under the euphemistic guise of pyrotherapy experimental inoculations were made into mental patients Blood from a case on the fourth day of the disease was injected intramuscularly into a patient with dementia praecox This patient developed the disease and served as the starting-point for a series of twenty-one passages Altogether seventy-eight subjects were inoculated, some with blood, some with urine, and some with cerebrospinal fluid The incubation period of the experimental disease was usually about twelve days and the duration about nine days Clinically the fever and the typhoid-like symptoms were present, but

(viii) Residual symptoms having at least the severity of those termed traumatic psychasthenia are very common The condition is of good prognosis up to about two years but any change which persists longer than this is apt to be permanent In assessing the degree and importance of residual defect standardized tests are of little value Symptoms that are reported by a reliable and unbiased witness as occurring but which cannot be detected at interview must be accepted Many of the minor changes of this condition—such as lack of initiative retardation loss of memory for engagements, indecision—which need not transpire at interview may destroy the usefulness of anybody doing responsible work

(ix) While the syndrome traumatic psychasthenia may remain stationary it may on the other hand be the starting point of a progressive deterioration into dementia

(x) Permanent change is more likely (*a*) at the extremes of life (*b*) when organic disease exists—for example arterio sclerosis (*c*) when there is a constitutional psychopathic tendency It must be recognized however that even in young adults and even in absence of any of the grosser psychotic sequels traumatic psychasthenia may persist.

MENTAL SYMPTOMS ASSOCIATED WITH HEAD INJURY

THE NEUROLOGICAL ASPECT*

BY

J P MARTIN, M D, F R C P

Physician to Out Patients National Hospital for Nervous Diseases Queen Square Neurologist to the British Postgraduate Medical School

In considering the mental disturbances which frequently result from injuries to the head we recognize at once two groups or chains of possible causal circumstances The first consists of material elements and comprises the organic injuries of the brain and the subsequent reactive changes in the cerebral tissues The second consists of abstract elements and comprises the emotional disturbances connected either immediately with the accident itself or with the patient's adaptation to his normal life afterwards and if the question of compensation arises it adds to this group further elements of anxiety and possibly greed Both the material and the abstract factors react by their different means on a mental constitution and a mental content which are in large measure peculiar for each individual The thread of the material effects and the patient's mental constitution are the warp and the woof of the weave of mental symptoms and the emotional effects are printed on, but we who find it difficult enough to make out the pattern may often be in doubt as to what is imprint and what is woven in the texture

The range of our subject includes cases of many different kinds and I have grouped them below chiefly according to their physical nature, but I shall have time only for brief discussion of two or three of these groups

Classification in Groups

The subject as I see it contains the following groups In many cases the initial mental symptom is unconsciousness using the word in its popular sense—that is to say, the abolition of all signs of mental activity

1 Cases of simple concussion in which the unconsciousness is usually of brief duration and there is no indication that the brain has been organically injured—I have never seen any mental symptoms persisting in such cases with the exception of one quite atypical instance which will be referred to in group 7

2 More severe cases in which unconsciousness is usually more prolonged and there is conclusive or strong presumptive evidence of organic injury of the brain—In such cases recovery is occasionally characterized by profound mental disorder lasting many weeks or months and it is with such instances that we are most concerned to-day

2a Rare cases of this kind in which recovery having reached a certain stage relapse occurs and the patient sinks into a state of dementia—cases of "late dementia"—I have seen three such cases and the descriptions of them are fairly common in the literature

3 Cases in which there has been actual loss or known gross local damage of cerebral tissue which may in itself be responsible for mental changes—I have in mind cases with open wounds through which cerebral tissue has been extruded cases of gun shot wounds and perforating injuries and cases of depressed fracture in which the damage is local

4 Cases of intracranial haemorrhage particularly (*a*) traumatic subarachnoid haemorrhage and (*b*) subdural haematoma—Here the physical factors appear relatively simple while on the psychological side the cases differ obviously from those of the earlier groups in that the sequence of mental changes is from normality down to coma instead of from coma upwards

5 Cases in which fits occur and are accompanied by intellectual deterioration—The fits are likely to begin long after the injury and the factors responsible for the mental symptoms are evidently different from those operating in the preceding groups

6 Cases of so called traumatic neurasthenia—The physical evidences of injury if there were any have disappeared (or have been allowed for) but mental symptoms of a nature that we know well have become apparent This is a difficult and complex group which we must try to unravel

7 Cases in which the mental symptoms persisting after the accident are those of one of the well known types of psychosis and probably depend essentially on the patients antecedent mental constitution—Cases of manic depressive psychosis schizophrenia and paranoia have all been described following head injuries I have myself had one case in which a dementia with schizophrenic features followed in a boy of 16 an injury which caused unconsciousness for about half an hour and no outward signs of organic damage to the brain It is difficult to know for how much the physical factors count in such instances

Stages towards Intellectual Recovery

In group 2 the physical concomitants usually leave little doubt that the brain has been organically damaged There are probably signs of fracture of the skull and possibly cranial nerve disturbances reflex changes signs of local weakness of limbs or blood in the cerebrospinal fluid The initial stupor may last a number of hours or several days and the return of mental activities is gradual In the vast majority of cases the patient passes as "normal" mentally within a few days and if I describe cases in which recovery takes weeks or months it is because of their great intrinsic interest and because of the light they throw on other cases The course of events is somewhat as follows

THE IRRITABLE AND NOISY PHASE

The patient ceases to be entirely passive when moved or touched and makes grimaces or movements—and soon utters words—expressive of resentment Within a very short time he may become abusive when attended to or even when spoken to This phase varies in duration from a few hours to many weeks It is sometimes accompanied by periods of restlessness and noisiness, and I have had

*Read in opening a discussion in the Section of Neurology and Psychological Medicine at the Annual Meeting of the British Medical Association Belfast 1937

opening of the vagina, but they show a gradually diminishing intensity of the remaining effects Doses below 1/16 mouse unit do not give indications which can clearly be associated with gonadotropic activity Similar gradation of effects was obtained with the immature male mouse, in which the action of the hormone on the testicle, epididymis, seminal vesicles, prostate, and penis was studied As in the case of the female, three phases—Ia, Ib, Ic—are distinguished corresponding to 1/4, 1/8, 1/16 mouse unit Phase Ia includes hypertrophy of the penis and intense keratinization of the glans hypertrophy of the testes and seminal vesicles, great interstitial and epithelial hyperplasia of the testes but little effect on spermatogenesis, whilst Ib and Ic show diminishing reactions except in the matter of spermatogenesis, in which the larger dose, 1/4 mouse unit, seems less effective than 1/16 mouse unit Using these criteria on the cerebrospinal fluid of human subjects Monnier was able to demonstrate that normally no gonadotropic hormone can be found, in cases of intracranial hypertension very small amounts of the hormone are detectable in the cerebrospinal fluid, but always less than can be detected in the urine or blood The same is true for the ventricular fluid In a series of twenty cases of cerebral tumour tests were carried out on urine, blood, cerebrospinal fluid, and ventricular fluid, with the result that positive Aschheim-Zondek reactions were obtained in nine cases The reaction seemed to be conditioned by the position of the tumour it is frequently positive when the tumour is frontal or in the neighbourhood of the sella turcica, and especially when the tumour is basilar—that is in the region of the thalamus or pineal gland Parietal, temporal and cerebellar tumours did not yield positive reactions Of fifteen cases of various other neurological conditions, only three gave weak positive reactions As no greater quantity of hormone was ever found in the cerebrospinal fluid than in the urine, it is sufficient in any given case to test the urine only Whilst these results are as yet rather of academic interest, it is worth observing that the pituitary can share in the general disturbance from a cerebral tumour by exhibiting a demonstrable hyperfunction

CORPUS STRIATUM AND MAINTENANCE OF EQUILIBRIUM

The relation of the cerebellum the sensory system, and the labyrinth to the mechanisms of equilibrium and posture is now well recognized Physiological and pathological studies have been directed towards elucidating the nature of the peripheral reception, both internal and external the mode of collection and correlation of the impressions received, their transmission to the special centres and the evolution of those motor responses resulting in a maintained balance Much is known of the function and mode of action of the peripheral receptors in the control of posture and equilibrium On the anatomical side a great deal of work has been directed towards tracing the conduction path from the labyrinth to the central nervous system but this still remains undetermined Both clinical and physiological evidence, however, leave little doubt of some intimate functional connexion between the vestibular apparatus and the anterior frontal area Experimental research has demonstrated the importance of the mesencephalon in the reflex regulation of posture The pathological changes in the corpus striatum and mesencephalon found in cases of post encephalitic Parkinsonism have directed attention to the probable functional relation between the corpus striatum and the vestibular apparatus Delmas-Marsalet, Berguignan, and Verger[1] have recently published a review of the problem and have made some important experimental and clinical observations They destroyed parts of the corpus striatum in dogs by a special technique and studied the subsequent spontaneous behaviour of the animals as well as the effects of rotation and cocainization of the labyrinth They found that the animal with one caudate nucleus destroyed presents a slight curvature of the neck towards the injured side and a tendency to turn towards the same side If one lenticular nucleus is destroyed the curvature of neck and spine towards the injured side becomes very marked, and rapid circus movements towards the same side are established After either of these lesions labyrinthine tests give rise to peculiarly dissociated reactions thus nystagmus is normal, but posture and rotatory reactions occur with great intensity towards the operated side and are absent on the unoperated side, "as if the lesion of a *noyau strie* facilitated the rotatory reactions, spontaneous or provoked, directed towards that nucleus, and inhibited the reactions in the opposite direction" Gross disturbances of equilibrium follow bilateral lesions thus destruction of the caudate nucleus on one side and the lenticular nucleus on the other leads to incoordination and a tendency to fall on the side Labyrinthine tests in an animal with bilateral lesions increase the disequilibrium, but excitations of each of the labyrinths provoke perfectly symmetrical reactions of a more feeble character however, than in the normal animal Delmas-Marsalet and his co-workers point out that this experimental syndrome is similar to that produced by an experimental lesion of the pre-frontal lobe Working on these lines they conclude that the pathway from the vestibular nuclei is to the lenticular nuclei spreading probably to the caudate nucleus and thence to the frontal cortex, the nystagmic reflexes are probably borne by collateral fibres given off in the mesencephalic region

We regret to announce the death of Dr Orlando Charnock Bradley, principal of the Royal (Dick) Veterinary College Edinburgh who was president of the Section of Comparative Medicine at the Edinburgh Meeting of the British Medical Association in 1927

[1] *Rev Laryng* April, 1937, p 353

and time may also represent some release of function—some uncovering of almost disused functions—again at a cortical level The circling of the patient s thoughts around a small number of ideas is probably largely due to the failure to receive new impressions at their proper value, or, while the patient is disorientated in time, it may be due to the liberation of a few memories of the period in which he fancies he is living In either case it would seem to be due to the partial release of certain functions and the failure of others

Most of these symptoms are probably the result of diffuse rather than local cortical disturbances but a major importance for the intellectual defects attaches, in my opinion to impairment of the function of the cortex of the frontal lobes Elation is also, I believe, the result of a frontal lobe disturbance I have seen it with localized injuries of the frontal lobe, and in its extreme form it merges with Witzelsucht ' or pathological tendency to joking, which also occurs with frontal lobe lesions

Prognosis

You will have gathered from the trend of my remarks that even when mental symptoms are prolonged their course is towards recovery, and in the majority of cases recovery is eventually complete It is seldom more than six months before the patient behaves as a normal individual, though he may still have some residual symptoms But you will have noticed, too, that I made a special sub group of certain cases in which after partial recovery the patients lapsed into a state of dementia which persisted I cannot stay to discuss this group further, but it is noteworthy that the youngest of my three patients was 55 years of age

Meningeal Haemorrhage

In all the cases we have been discussing the symptoms have begun with stupor and gradually or quickly receded I must make some mention of two small groups of cases in which it is possible to watch the progress of the symptoms in the opposite direction, from normality down to stupor I refer to the cases of sub arachnoid and subdural haemorrhage resulting from injury In the former subgroup stupor may take from a few minutes to an hour or two to develop, according to the severity and perhaps the site of the haemorrhage The symptoms are excitability restlessness irritability, unreasonableness, lack of reserve an activity which is rational but not fully comprehended and which is accompanied by a hypomanic emotional state, disorientation, confusion, then diminishing activity, paraphasia drowsiness stupor More frequently than not the early symptoms are marked by concussion

In this connexion I would like to tell the story of one of my patients who had a moderate amount ot blood in his cerebrospinal fluid He was knocked unconscious by a blow on the face, and his amnesia begins about five minutes before the blow At the time the blow was struck he and another man had agreed to have a fight and were on their way to a suitable place, it may be that his emotional state then had an effect on his subsequent behaviour He was taken unconscious ' (in the popular sense) to hospital He remained without signs of mental activity while a cut lip was stitched, and then rather quickly he appeared to come round He at once became extremely excited violent and threatening and was arrested as drunk by a policeman who had come with him in the ambulance He has no recollection of any of this, and was undoubtedly unconscious throughout He remained in the police cell for eight to nine hours, and late in the evening was bailed out comatose by his brother The next morning, still stuporous and irritable and, when roused, abusive, he was produced in court and, still quite unconscious, was actually induced to stand up while he was lectured by the magistrate and ' bound over ' He subsequently passed through a period of very noisy and unruly behaviour followed by confusion, disorientation perseveration, and so on, and it was nearly four weeks before he again became conscious

With the subdural haematomas the progress towards stupor is much more gradual and there is not the same element of irritability—not the same positive elements in the mental disturbance The decline can be watched over weeks or months, and the steps are those of a simple dementia reduction of mental and physical activity, reduction of interests, periods of disorientation perseveration of ideas amnesia, confusion drowsiness—all perhaps variable but increasing with each aggravation—and finally stupor

Although the course is downwards instead of upwards the actual symptoms in these two subgroups are similar to those of phases in the preceding cases

Our Ignorance of Essential Pathology

We are almost completely ignorant of the physical and functional changes in the brain which are essentially responsible for these mental symptoms following injuries, and I have not found in the literature any detailed patho logical reports of cases of traumatic psychosis In the great majority of cases the lesions in the brain are wide spread, and in the cases of intracranial haemorrhage an extensive area of cortex is affected either by pressure or by direct contact with effused blood, and it is rational to correlate the temporary dementia with depression of activity over such a considerable fraction of the cerebral cortex

Whatever the disturbance is which affects the brain after injury it is one that in certain cases takes months to recover Oedema, haemorrhage local circulatory disturbances the effect of degenerating tissue elements on the cortical cells damage to association tracts with subsequent compensation for the deficiency changes in the myelin sheaths, and reactive changes of the interstitial elements in the brain may all exert their influences, and in the presence of so many possible factors it is useless to theorize The elements of Korsakoff's psychosis which appear are probably due to the toxic effects of degenerating blood and other tissue

" Traumatic Neurasthenia "

It will perhaps have occurred to you that some of the cases that are dubbed traumatic neurasthenia are characterized by symptoms of the very same nature is occur in the final stages of recovery in the cases I have been discussing Such are slight confusion inability to think clearly, inability to sustain mental activity, lack of spontaneous conversation and spontaneous physical activity and lack of reading in a person who has been accustomed to read These are fairly good indications of a minor degree of that receding dementia which is a feature of the more obvious and prolonged mental disturbances and such symptoms undoubtedly have a basis in organic cerebral injury I always distrust the label ' traumatic neurasthenia if the patient s injury has been a serious one With this psychasthenia the emotional state is variable but more often leans towards depression There may be superimposed factors of anxiety arising from the

"HUXLEY, THE BRAIN, AND THE MIND"

PROFESSOR ADRIAN'S HUXLEY LECTURE

The Huxley Lecture at Charing Cross Hospital Medical School was delivered on November 18 by Professor E D ADRIAN M.D., F R S, of Cambridge, who gave it the title of "Huxley, the Brain, and the Mind"

It was ninety-five years ago, said Professor Adrian, that Thomas Henry Huxley entered that hospital as a medical student, after having served for a year as an assistant to Dr Chandler in Rotherhithe In those days medical studies were taken in an inverted order or in no order at all, for Huxley began in the surgery of a slum practice, and then went on to chemistry, physiology and anatomy at Charing Cross He took his M B after three years, became a surgeon in the Royal Navy, and was appointed to a frigate which was to serve in East Indian and Australian waters But on that frigate he found his abiding interest in zoology and was lost to medicine

Clinical Research in Neurology

A lecture which commemorated Huxley to medical students could hardly avoid reviewing the advances which had been made since Huxley was at Charing Cross As a physiologist the lecturer supposed that he ought to begin by celebrating the successful invasion of that science into medical teaching and practice But he was not sure that the invasion had not been almost too successful, for there was some danger that physiology, having penetrated into the realm of zoology on the one side and of medicine on the other, would become absorbed in the vast territories it had conquered and would cease to exist as an independent science For its offspring biochemistry the danger was not so immediate, though the biochemist had already made himself so indispensable to medicine that it might soon become difficult for him to follow his own devices How this situation would develop no one could foretell, and it was not really known how it ought to develop, but a balance should be struck between the academic and the practical There was one branch of science in which the two fields of interest had always blended In neurology true clinical research from Huxley's time onwards had had the closest possible relation to experimental physiology, and progress had been due to hospital wards and laboratories alternately For this reason the lecturer proposed a discussion on the present lines of advance in knowledge of the nervous system

After mentioning certain more academic branches of neurology in which there had been steady progress with no sign of unusual difficulties ahead, Professor Adrian said that all the evidence went to show that there was no reason to suppose the cell units of the nervous system to differ greatly from excitable cells elsewhere They were less stable, no doubt, and their reactions less stereotyped, but the mechanism of excitation and conduction was the same in them as in the muscle fibre The special properties of the central nervous system must be due to the special way in which its units were organized Up to a point the organization of the units was no more difficult to understand than their individual reactions, thanks to Sherrington's analysis of the reflexes, but the difficulties of analysis were of a different order on passing to higher levels of the nervous system and more fully integrated behaviour

The Labour Organization of the Brain

No detailed anatomical basis for memories and intelligent actions was available The 'factory' which produced the materials of consciousness was not made up of a vast number of independent sections which turned out a particular product There was a less degree of organization and a high degree of elasticity so that minor accidents had little effect on the other hand a major breakdown in any department might affect the efficiency of the whole concern.

The labour organization of the brain was illustrated by another set of facts relating to the changes in the general level of cerebral and mental activity As Head had shown, a loss of function due to destruction of the cortex was not a constant quantity, but depended on factors which could change rapidly and were related to emotional tension and alertness The normal fluctuations in the efficiency of behaviour seemed to depend on general factors of this kind

The parts played by cortex, thalamus, and hypothalamus in the change from sleep to waking or from anger to happiness were very far from being understood At present it was not known what change took place in the brain when something was learned, and it was important to realize the lack of knowledge in these respects All that could be said was that the cerebral cortex did not make up the whole of the mechanism for intelligent behaviour, and that the level of activity in any region might depend on interactions which included the more primitive regions as well Indeed, everything pointed away from an analysis of behaviour in terms of isolated reflexes and association systems, and the idea must be faced that the whole brain co-operated in any of its activities, although it was not known what kind of mechanism was brought into play

Far from this being a confession of failure, it meant that cerebral physiology was now facing its most important problem, and it was facing it armed with new methods of all kinds But the change in physiological outlook was noteworthy for another reason, because it corresponded in a measure with the change in psychological outlook which had come about since Huxley's death The change could be seen most clearly in comparing a modern textbook of psychiatry with one written fifty years ago In those early days psychiatry tried to advance, much as neurology was trying, by setting up hypothetical schemes of mental disorder and then forcing the symptoms to fit The key points of this scheme were not different cortical centres but the faculties of cognition, emotion, and volition, it seemed reasonable to analyse the disorders of the mind in terms of these faculties much as disorders of speech were to be analysed in terms of word centres in the cerebrum The attempt broke down in face of the bewildering variety of mental symptoms

The Freudian Conception

On the theoretical side the greatest change had come with the general acceptance of the idea that conscious behaviour was guided by a balance of unconscious forces and would be impossible without them For this Freud was mainly responsible The lecturer recalled the puzzled excitement with which Freud's theories were discussed by the medical students at Cambridge before the war The central idea then seemed as unlikely as was the detailed analysis of dreams and trains of thought Nowadays the central idea appeared to be too obvious to discuss, and whatever might be thought of the details of psycho analysis, disorders of the mind could scarcely be considered without making some use of the Freudian conception

No doubt this change had been assisted by the natural shift of emphasis as one generation succeeded another There had been other formulations of the same position, less challenging than Freud's Pavlov's work on conditioned reflexes, though it had little to do with psychology, had been far more important in one country in changing the popular conception of the mind

But whatever its causes the change had had far-reaching effects, more on social behaviour generally than on the specialized activities of neurologists and psychiatrists for there was more to change in the layman's point of view It had altered the relation between parents and children, and made people less sure of themselves "We are less shocked than we might have been at the idea of developing beliefs and loyalties by State propaganda, more ready to accept the challenge that our scientific deduc-

2. Vaccination with killed virus

Heat, formalin or phenol and a further modification of virus absorbed on inert protein or other material

Herpes and Zoster

Let us consider what has been tried and what accomplished in the treatment of skin diseases due to viruses first, in the case of herpes Andrewes and Carmichael (1930) demonstrated the presence of antibodies in all of seven cases of frequently recurring herpes, and they made the observation that in some obscure way herpes can occur in man despite the presence of antibodies in the serum This finding was confirmed by a different test (Brain, 1932) specific herpetic antibody was found in thirty out of thirty two individuals who were subject to herpes, and in two cases of recurrent herpes repeated tests showed the constant presence of antibody It was thought that a transient local lesion like herpes could scarcely account for the persistence of antibodies in the serum, and it seemed probable that these patients were carriers of the virus, for there is some evidence that such carriers exist

Apparently when the antibody content of the serum is below a certain level active herpetic lesions can occur In some cases it would seem that a second infection, such as pneumonia or the common cold, renders the patient susceptible to the herpes virus already present It is reasonable to suppose, therefore that if the antibody content of the plasma can be raised above a certain threshold the herpetic virus will be unable to produce active lesions Two methods of raising the antibody titre have been employed Hruszek (1933) claimed a high percentage of success by vaccinating patients with the vesicular fluid of their own early herpes lesions In 1936 I described a more cautious method in which a formalized 10 per cent suspension of herpes-infected pads of guinea pigs was used, and very successful results were obtained in a few cases of frequently recurring herpes although some cases did not respond at all With Hruszek's method it is sometimes difficult to get positive takes from patients vesicles Sufficient data, however, are not at present available by which to estimate the relative value of these two procedures

So in the case of herpes specific treatment of some value may be tried but its success cannot be guaranteed, and such treatment should undoubtedly be reserved for cases of frequently recurring herpes which are not improved by local *x* rays and general tonics It might be added that fractional doses of *x* rays—for example one-third pastille dose (90 kV, 3 mA, 0·5 mm. Al screen, 120–150 *r*) repeated at three weeks interval, for three doses—to a constantly affected site of eruption seem to desensitize the skin and often prevent or mitigate the severity of the subsequent lesion

In the case of zoster, of course the eruption rarely recurs and since the slight warnings of an impending attack are often unappreciated until the eruption appears prophylactic treatment can seldom be attempted No doubt zoster convalescent serum would be of considerable use if it could be given three or four days before the eruption occurred but for the reasons stated this is usually impracticable When the disease is manifest specific treatment is unlikely to avail and perhaps the two most successful treatments are posterior pituitrin extract by injection and sodium iodide in large doses by mouth or intravenously Unfortunately the extreme variation in severity and duration of the attacks of shingles makes it very difficult to assess the value of any therapeutic measure, but impressive results have been recorded after the use of these drugs

Warts and Molluscum Contagiosum

With regard to warts and molluscum contagiosum the *virus is embedded in the nucleus or cytoplasm* of the epidermal cells, and it seems unlikely that the quiet reaction it provokes would account for any significant antibody response on the part of the host or, if such antibodies were circulating in the blood stream, that these would be able to penetrate the cell membrane and affect the virus

I have been unable to demonstrate the presence of antibodies in patients serum and have had no therapeutic success from injecting vaccines prepared from warts or the lesions of molluscum contagiosum The spontaneous disappearance of warts is more likely the result of an abiotic change in the virus than of the destruction of the virus by specific antibodies Of the non specific methods of treating warts probably paints of various kinds are most commonly employed A well known one is 10 per cent salicylic acid in flexible collodion Owing to the horny surface of a wart it is essential to use a keratolytic substance, and caustic potash, phenol, and glacial acetic acid belong to this category A useful combination is the following

Phenol	10 parts
Glacial acetic acid	10 ,,
Salicylic acid	10 ,,
Strong tincture of iodine	20 ,,
Industrial methylated spirit	ad 100

Success may often be obtained by constant daily applications of such remedies, assisted by the cautious paring away of the keratin layer Attention has recently been drawn to successful treatment by covering the warts with strapping, but this method, too, often fails

In other cases it would appear that warts disappear if mild inflammatory reactions are provoked in their vicinity and it is quite likely that the success which often follows x ray therapy is due to this fact Ionization is another good method which probably acts in the same way, it has proved particularly useful in the case of paronychial warts The lesions are cleaned with ether and then painted several times with liquor potassae to soften the keratin, remove grease, and increase the conductivity of the skin The fingers are then dipped in a 1 per cent solution of magnesium sulphate which is in contact with the anode of a galvanic battery, and a current of 5 to 10 milliamperes is passed for thirty minutes Dr Grace Griffith has obtained considerable success with this method in my clinic at St. John's Hospital for Diseases of the Skin As a rule weekly treatments were given but in obstinate cases more frequent applications were advantageous

No doubt the occurrence of spontaneous resolution occasionally accounts for a success claimed by the milder methods of treatment mentioned above This applies to a greater degree when one considers the general methods employed in the treatment of warts, and the multiplicity of these treatments indicates their unreliability An old fashioned remedy is 1 oz of liquor calcis three times daily and it has been claimed that magnesium sulphate in doses sufficient to produce three liquid stools a day is often successful Small doses of arsenic by mouth have been advocated, and a more recent treatment is the intramuscular injection of mercury salicylate Others prefer pills containing the green iodide of mercury in doses of one sixth to one grain three times a day My measure

influencing their work more and more, alike those who worked in the sphere of public health and those who practised individual medicine In this reorientation they all came nearer together, as witness the present drive for national health in which both sections united The efforts of the medical officer of health and of the family doctor were both necessary, and they should pull together He had been impressed by the manner in which medical officers of health were specializing upon certain aspects of their work, for example, one would concentrate upon ventilation, another upon accident prevention, and another upon the important subject of food By reason of their specialization, not only medical officers of health but the medical profession in general was making an enormous contribution to national fitness The present campaign dealt more with biology and less with pathology, but health services as such could not be "got across" without the help of the family doctor

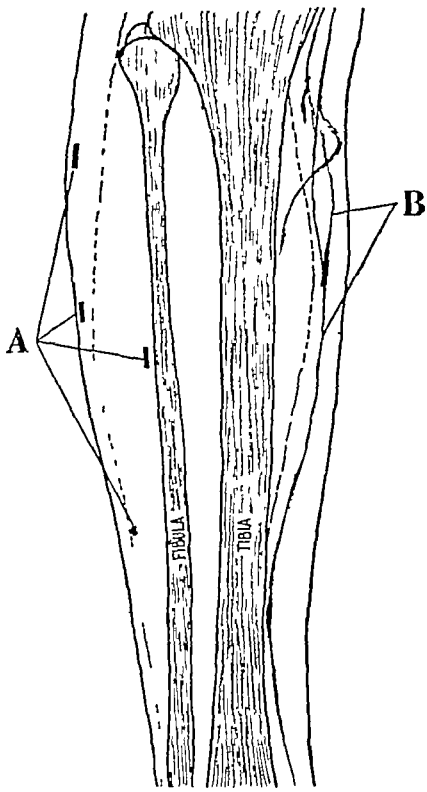
Lord SNELL paid a tribute to the medical staffs of the administrative authorities of the country Those authorities, he said, did not regard their medical staffs as paid officials, but as partners in carrying out the policy decided upon In his view the authorities had a duty towards doctors in equal measure to the duty of the doctors towards the authorities, for the work of medical officers of health in such matters as tuberculosis and the effect of slum conditions upon health generally was altogether beyond praise, and an authority which ignored their advice would be gambling with the health of the people When an epidemic came the weight of criticism fell on the medical officer, and yet it might be that this had happened because the advice of the medical officer had not been followed In spite of the great strides of preventive medicine we were in some respects still behind The vermin-infested and fever-stricken areas in great cities must be abolished, the smoke nuisance must be abated, and the great problem of noise remained still to be tackled

Reports of Societies

PSYCHOLOGICAL APPROACH TO RHEUMATISM

In the Section of Physical Medicine of the Royal Society of Medicine on November 19, with Dr F D HOWITT in the chair, a discussion took place on "The Psychological Approach to Rheumatism"

Dr J L HALLIDAY said that medical science had so far proved ineffective in the disorders labelled with such terms as gastritis, peptic ulcer, chronic bronchitis, and rheumatism What was an ill person? A useful working definition was 'A person who is not himself' In the absence of the psychological approach the range of observation might be too narrow, and the deductions therefore inadequate In considering the cause of illness it was necessary to bear in mind the kind of person, the nature of his environment, and the mechanism of his illness The psychological factors in environment included those happenings which frustrated instinctive drives, such as the deep-seated tendencies towards self-preservation When these drives were frustrated emotion resulted, and if the emotional reaction was maintained illness might well arise, physiological mechanisms being concerned in emotion



Applying these considerations to non-arthritic rheumatism—to which he limited himself—Dr Halliday said that his observations concerned patients labelled 'rheumatic' who complained of pain and stiffness, but presented no evidence of obvious structural change Their modes of behaviour would have been labelled more accurately as psychoneurotic—anxiety states and hysteria Patients who developed rheumatism in the course of emotional reaction tended to date the onset of their illness to the time when the rheumatic symptoms first appeared Their preceding disturbances might have been very definite and severe, and have included mental symptoms, but their consciousness was dominated by their rheumatism During physical examination attention should always be paid to the patient's face and manner The facial expressions which gave the hint that the illness might have emerged from emotional reaction belonged to one of two groups—the anxious and the cheerfully detached The first might be described as strained, tired, hunted, or worried, and the appearance was often associated with tachycardia or visceroptosis The "detached face" might be wistful, complacent, smiling, or even spiritual, and this was sometimes associated with a marked thudding of the aorta in the epigastrium

Much could be learned by preliminary questions Of particular interest were the patients who protested too much, and repeated such phrases as "I was never one to give in" These often complained of stiffness of the head or back The person who developed rheumatism as an emergent from emotional reaction might be of either sex and any age, though the maximum age distribution of onset was 35–45 The history of previous illnesses was important. Many of these patients had on previous occasions responded to like stresses by illness which emerged from emotional reaction An inventory of these illnesses included such terms as anaemia, headache, recurring colds, nervous breakdown Certain occupations seemed more liable than others to psychoneurotic illness in males, miners, workers at heights, and clergymen, in females, typists, housekeepers, cleaners, and piece workers, in both sexes, teachers, canvassers, travelling agents who worked on commission, and persons in sheltered clerical occupations in which the instinct of creation was continuously thwarted

Psychological Mechanisms

In rheumatism emerging from emotional reaction a common psychological factor was the loss of a loved object, whether person, career, or money Dr Halliday went on to draw attention to a few simple psychological mechanisms Inherited patterns of behaviour might play a part in determining the nature of a person's reaction There was a common belief that one family tended to be 'chesty," another to be highly strung, a third to have weak stomachs Another factor was acquired bodily inferiority During emotional reaction pains and other symptoms tended to be located in parts of the body which had been affected previously by operation, injury, or disease Yet another factor was fears and knowledge of disease It was not uncommon for a medical student or nurse to go to the teacher and express the fear of having developed some illness of a serious nature, usually this happened during an anxious time just before an examination A little knowledge of medicine might be highly dangerous to health Health lectures, newspaper articles on disease, magazines devoted to the body, and medical dictionaries were part of the everyday environment, and by these means the instinct of bodily preservation was constantly being tickled As a result, when a person developed an emotional reaction he might accept from what he had heard about disease the idea that he was the victim of a grave illness, and the nature of the illness so selected might determine in part his bodily symptoms Of deeper importance was the mechanism known as identification—the tendency of a person to behave in the same way as those around him A good example was the morning sickness of a young husband when his wife was pregnant for the first time Pains diagnosed as rheumatic sometimes developed in this way The examination of any patient with rheumatism was incomplete, and the inferences made might be misleading, if the investigation was not directed to the illness or death of a loved person Still another mechanism was symbolism—a symbol being

it set up as a foreign body caused the formation of granulation tissue which contracted, strangling all the channels within its grasp Finally, the silk thread is isolated like a long worm lying loose in an impermeable sheath If this is true, it would appear that lymphangioplasty is unsound in theory, and can give only temporary benefit even in the arm If drainage is effected and does persist, we can only suggest that the density of the fibrous sheath may depend upon the nature of the silk used and its mode of preparation or that it remains incomplete (fenestrated) or otherwise permeable by fluids (The hardest fibroids are living and moist, and evidently lymph percolates through them) It hardly seems possible that the sheath is absorbed as time goes on, leaving the

A represents fragmented portions of silk visible on the radiograph in the soft tissues of the outer aspect of the leg on the inner aspect (B) are faint opaque linear shadows

silk to act as a drain Lymphatic vessels and lymphatic glands can arise *de novo* in the human body and possibly a collateral circulation of both lymph and venous blood develops the blocked vessels may also regain their patency All these matters call for discussion however, for we cannot agree that the silk is destroyed our radiographs prove the contrary

The Fate of Silk

Thirty years ago surgeons used silk much more freely than nowadays We were rather afraid of embedding long pieces because if they became infected—from external or internal sepsis—trouble followed, and sooner or later the silk would be discharged. We were not certain to what extent the silk would be absorbed or whether it would remain permanently embedded in a sheath of fibrous tissue or persist in some altered form It appears that this uncertainty remains to this day, for instance it is easy to find in the literature such statements as "it is claimed that Japanese silk is absorbable' and of silk saturated with mercuric biniodide and stored in liquid paraffin it is not absorbed, but is assimilated by the tissues forming the basis of a structure closely resembling tendon It gives rise to no irritation and does not tend to work out (In the case reported here Chinese twist impregnated with biniodide of mercury was used)

We submit that our radiographs prove that some of the silk inserted in our patient twenty-four years ago has remained practically unaltered without causing the slightest trouble Therefore, we cannot agree with the Cairo authorities who found—in healthy guinea pigs after twenty one days— that 'the fibrils of the silk were slightly separated and broken up into strands by trabeculae of connective tissue passing inwards into the thread, and that this process must eventually lead to its complete disappearance and the formation of a solid column of dense fibrous tissue along which no absorption of fluid of any kind can possibly occur In some of their sections the silk was so loose that it fell out, and, therefore, could not have been invaded

Conclusion

As regards the case reported, the perfect result cannot, after mature consideration be claimed as due to the lymphangioplasty It is not known why the brawny oedema came on so late, and the improvement after operation was 'slow but continuous' whereas the benefit other surgeons have described has appeared soon after operation but has not persisted We give all the credit to the *vis medicatrix naturae*

My thanks are given to Dr Kemp Harper for his excellent work, and to Dr E. C Myott of Stoke on Trent for kindly help and criticism As it has been found impossible to reproduce sufficiently clearly the opacities seen on the original films prints have not been forwarded but the films have been placed in the hands of the Editor of the *British Medical Journal* for his scrutiny

R Castaneda Palacios (*Dtsch med Wschr* July 23, 1937) has investigated the Chediak syphilis reaction at *Professor Schittenhelm's hospital in Munich, applying it* to 536 patients seventy-eight of whom were syphilitic The disease was tertiary in sixty-eight cases secondary in five primary in three and congenital in two Chediak's reaction was positive in seventy cases (89 7 per cent) whereas the Wassermann reaction was positive only in fifty six cases (71 7 per cent) In none of the 458 non syphilitic patients was Chediak's reaction positive, although they represented a wide range of diseases including malignancy, infectious diseases and disorders of metabolism But the author agrees with Chediak himself in applying clinical and laboratory tests to doubtful cases He describes a case in which the Chediak reaction was thrice negative, while the Wassermann reaction was at first positive The patient was a man, aged 41 whose vague cardiac symptoms had suggested a diagnosis of vascular syphilis The subsequent course of the case and a Wassermann reaction which was negative when repeated suggested that Chediak's reaction was the more delicate and reliable of the two

trate too much on the hunt for the organism, with a comparative neglect of other dangers Eclampsia was the commonest cause of toxaemic death Of 110 cases of eclampsia thirty-four came from L C C clinics, and six of them died In the other seventy-six emergencies there were fourteen deaths

The fact that 30 4 per cent of the cases of albuminuria had haemorrhages showed that this complication was bound up with the prevention of toxaemia During the six years under review no woman who had attended the L C C ante-natal clinics had died of accidental haemorrhage In 375 cases of placenta praevia seven were lost directly from haemorrhage and three from sepsis As to obstetric shock, cases which came in after having had outside interference constituted a tragic series of mismanaged labours In regard to anaesthesia, little chloroform was given, but personally Dr Fairfield was not as scared of it as were others Out of 781 Caesarean sections there were four deaths following spinal anaesthesia, but no deaths from any other kind of anaesthetic

General Discussion

Professor MUNRO KERR submitted that no proper comparison was possible between the L C C figures and those of maternity hospitals in the provinces, in the latter from 20 to 40 per cent were emergency cases, as against 10 per cent of the L C C cases not previously booked for delivery at hospital The L C C reduction in maternal mortality had been most striking in the cases other than those due to sepsis He objected to the frequently repeated statement that auto-infection was only of minor importance, in two series of cases at Aberdeen localized infection in or on the patient's person was responsible for 30 per cent of the fatalities It should be possible almost to eliminate extrinsic infection by the use of masks, gloves, isolation of infected patients, restriction of visitors to patients, and limitation of the number of patients in each ward Professor JAMES YOUNG remarked that in all the series of figures sepsis was the most important factor in maternal mortality It could still be argued with some force that one of the most important risks run by women who entered maternity hospitals was that of puerperal sepsis, ten years ago that risk was considered to be six times as great as when the woman was delivered in her own home In sepsis the great problem was that of the carrier, a second problem was that of toxaemia, and the L C C hospitals had been remarkably successful in safeguarding against the major risks of fulminating toxaemia

Dr W H F OXLEY said that Dr Fairfield had rightly stressed the importance of an immediate swabbing of the cervix and a bacteriological examination in any patient showing a rise of temperature, because the presence of the haemolytic streptococcus constituted a more serious problem than that presented by the staphylococcus or the *B coli* group Dr ARNOLD WALKER gave a short account of his work at Willesden, where there were 2,900 births in a year, one-third of the number taking place in the Willesden Maternity Hospital The stillbirth rate was under 3 per cent, the infant death rate 1 8 per cent In all the booked cases in the year there had been only five maternal deaths, and only two cases were proved to be infected with haemolytic streptococci

In further discussion Professor MILES PHILLIPS (the president) considered that Dr Fairfield s contribution constituted a good plea for the institutional care of cases of labour Professor C G LOWRY of Belfast considered that fifty years hence no woman would be delivered in her own home unless her case was one of really precipitate labour and there was no time to transfer her to an institution The overstressing of the dangers of employing forceps was sometimes responsible for an unnecessary prolongation of the woman s sufferings Mr EARDLEY HOLLAND emphasized the present-day safety of women who were delivered in a first-class maternity hospital in preference to their own homes

PLASTIC SURGERY

At a meeting of the Devon and Exeter Medico-Chirurgical Society on October 28 Sir HAROLD GILLIES gave an address on the scope and developments of plastic surgery

Sir Harold discussed his subject under three main headings (1) scarring from minor injuries, treatment of naevi, etc , (2) conditions necessitating major operations, and (3) recent operations undertaken for the remedy of deformities resulting from paralysis of the facial nerve The first two parts were illustrated on the screen, and the third by the cinematograph He dwelt upon the frequency of motor accident injuries, and the care that must be taken to avoid disfigurement This was by no means always possible, although the importance of the early and efficient primary suture could not be over emphasized He had had experience of cases requiring treatment for the bites of various animals, including the dog, lion, and horse—that from the last-named being especially injurious He had seen dog bites of both the nose and lip, and in one of the former the tip of the nose had been immediately recovered and replaced In another more severe instance it had been necessary to rebuild the nose anteriorly by means of a flap turned down from the forehead and folded into the nostrils, healing took place in three weeks In a cut from broken glass involving the bridge of the nose a portion, including a minute slice of cartilage, had been recovered and sutured into place about ten hours after the receipt of the injury In the repair of the eyelids he often had to obtain tissue from the ear, but where feasible the opposite eyelid offered the best possible material In petrol burns causing ectropion thick razor-grafts were indicated, and where the eye socket was injured, especially by caustics, he advocated the complete removal of mucous membrane and repair with skin In a case of serious disfigurement resulting from a burn on the parieto-frontal aspect of the scalp he showed how it had been found possible to rotate the scalp, and by bringing it forward allow complete adaptation to the raw surface, which represented the area of the excised scar

Bony Injuries of the Face

The lecturer, touching upon bony injuries of the face, mentioned the frequency with which displacements of the internal extremity of the malar bone escaped notice Diplopia might be present and difficulty in opening the mouth, and irregularity of the orbital ridge was often evident, *x*-ray examination would reveal contraction of the antral cavity Reduction was best effected by means of a lever inserted along the deep temporal fascia from above Fracture of the nasal bones often escaped notice at the time of the injury and became apparent later, either on subsidence of the overlying haematoma or on x ray examination For reduction of the displacement a general anaesthetic was advisable, and Ash s forceps had proved most effective In such cases he was not content until he had satisfied himself that he could reproduce the reverse deformity before replacing the bones in their normal position

He showed two cases of hairy mole on the face, one of these bilateral and extensive, giving a leonine appearance He had found that a graft was worth trying in these cases—a rotation flap wherever indicated He deprecated the use of carbon dioxide snow except in the treatment of small capillary naevi of the face, he had experienced considerable difficulties in cases in which unsuccessful attempts to treat naevi had been made previously with snow or with caustics In the removal and subsequent repair of an ulcer of the face and lip which had become carcinomatous it had been found necessary to approximate the lips by suture as a stage in the remoulding by grafts Illustrations of repair of a large naevus on the right side of the face by a pectoral flap were also shown For the treatment of a cavernous naevus he strongly advocated radium needles at the earliest

THE ANTUITRIN S INTRADERMAL PREGNANCY TEST

BY

A MORTON GILL, M D, M R C P
Medical Registrar Middlesex Hospital

AND

JOHN HOWKINS, M D, M S, F R C S, M C O G
Gynaecological Registrar Middlesex Hospital

Many attempts have been made to devise a pregnancy test which is simple, rapid, inexpensive, and accurate those of Friedman and Aschheim and Zondek most closely approach this ideal By repeated and universal trial they are acknowledged to have reached a high degree of accuracy—namely, 99 per cent in the non pregnant and 97 per cent in the pregnant woman Both tests however, retain certain inherent disadvantages they are relatively expensive they require two and four days respectively for their interpretation and they demand the co-operation of a skilled biochemist for their performance Any test, therefore, which is to supersede these must possess not only their proven accuracy but also the properties in which they are deficient

With these ideals in view, and hoping to overcome the threefold disadvantage of the biological test, Pollatschek and Porges (1929) devised the intradermal sensitivity test, using a preparation of gonadotropic hormone They claimed absolutely reliable results Deutsch (1929) Strauss (1930) and Dowell (1933) substantiated the original workers findings they were followed by Gilfillen and Gregg (1936) who used a purer preparation (antuitrin S) with similar results On the other hand Weisman and Yerbury (1937) using the same technique as Gilfillen and Gregg reported the following figures seventeen non pregnant single girls, sixteen pregnant, twenty six male medical students and physicians twenty four pregnant nineteen pregnant women two non pregnant from which they naturally concluded that the test was worthless

Another intradermal pregnancy test was elaborated by Gruskin (1936) and later by Schwartz (1936), using placental extract the technique and rationale being similar to that of the antuitrin test Many of their results were however, equivocal, and the test is now regarded as fallacious in this country (*British Medical Journal* October 16 1937, p 757)

Feeling that no exhaustive trial had been made of the antuitrin test in England and fearing that its enthusiastic adoption by practitioners might lead to serious clinical error we determined to investigate its accuracy in a large series of cases faithfully following the technique of Gilfillen and Gregg and reading the results at one half one and two hours Our material consisted of 147 cases (forty nine males and ninety-eight females) Seventy-three of the women were between the fourth and ninth months of pregnancy and twenty five were non pregnant, fifteen being in the pre menopausal and ten in the post menopausal age

TABLE I—*Showing Results of the Active Antuitrin S Test*

	Positive (Non Pregnant)	Negative (Pregnant)
Males	44	5
Females (pregnant)	51	22
Females (non-pregnant pre-menopausal)	13	2
Females (non-pregnant post-menopausal)	8	2

These results were so palpably inaccurate that we abandoned further investigation of the antuitrin test at this point

Reasoning that the reaction obtained in those cases which showed a positive skin flare was perhaps not due to the active hormonal content of the injected substance but to the presence of foreign protein, we further tested forty one cases (ten males, thirty one females), using inactivated antuitrin S Twenty one of the females were between the fourth and ninth months of pregnancy and ten were non pregnant The results were as follows

TABLE II—*Showing Results with Inactivated Antuitrin S*

	Positive (Non-Pregnant)	Negative (Pregnant)
Males	10	0
Females (pregnant)	12	9
Females (non-pregnant)	10	0

From the above figures it is evident that the results of this test are as fallacious as those obtained with active antuitrin S

Conclusion

The antuitrin S intradermal test for pregnancy which has been so enthusiastically acclaimed, has proved in our hands to be valueless

We are indebted to Dr T Izod Bennett who sponsored this investigation and to Mr L Carnac Rivett for permission to test patients under his care Messrs Parke Davis and Co very kindly supplied the antuitrin S used in this investigation.

A Mayer (*Münch med Wschr* July 23 1937) discusses from the point of view of sickness insurance the rate of growth of cancer of the cervix In general he concludes that a woman with this condition who became insured six months before the diagnosis was made must have had it at that time if the growth is inoperable, but may not have had it if the growth is an early one Stähler analysing 200 cases, has estimated that the average duration of the initial symptomless period is 2 7 months Very great variation however is shown in the rate of growth As examples of slow growth cases are cited of women aged from 34 to 44 who had had symptoms for one to six months but in whom the growths remained operable and practically stationary for ten to fifteen months so that they were still classified as operable fourteen to twenty-one months after the first onset of symptoms On the other hand Mayer has seen a woman aged 22 who had had a blood stained discharge for fourteen days and presented an early ulcerating carcinoma of the portio with a metastasis in one fornix ten days later the primary growth had attained the size of a billiard ball and death followed after eight days Weinzierl found microscopically adenocarcinoma in a non hypertrophied but eroded cervix and saw nine days later a cauliflower tumour the size of a small hen's egg which was found to be an aggressive cylindrical-cell carcinoma of immature cell type with much penetration of lymph vessels

self-confidence of a child Organ inferiorities might become the stimulus to higher development or the determinants in the choice of careers These studies in organ inferiorities and their psychical compensations led Adler to the study of the origin and consequence of feelings of inferiority

Dr Dukes was not satisfied with the use of the word "inferiority" as applied either to the body or to the mind He warned against hasty assumptions with regard to inferiorities and supposed compensations, and gave examples He spoke of the absence of "controls" in Dr Adler's theories The value of Adler's work lay in the teaching that physical ills and defects were not necessarily injurious, but might be of value to the sufferer

CLINICAL VALUE OF THE TOMOGRAPH

At a meeting of the Section of Medicine of the Royal Society of Medicine on November 23, Dr H LETHEBY TIDY presiding, the subject of discussion was the clinical value of the tomograph Tomography is the "sectioning" of an organ or part by x rays, so that it becomes possible by successive images to analyse the subject in slices and then to give synthesized reproduction of the structure, other terms such as 'planography," "stratography,' and "laminography' are also current

Dr J B MCDOUGALL discussed the value of the tomograph in the elucidation of chest conditions, particularly pulmonary tuberculosis There was no department of medicine which owed more to radiology than that which had to do with diseases of the chest The *x*-ray film could convey much more than any individual sign or group of signs could discover But the radiologist would agree that the usual antero-posterior, lateral, or oblique x-ray view left out much detail At a time when the surgeon had come into the field of chest diseases, accuracy in localizing cavities, for example, and in determining the pathology of any lesion was ever more imperative One of the difficulties in interpreting chest radiographs was due to the superimposition of the normal structures of the chest and of certain pathological deposits in the lungs themselves Perhaps no radiograph was more difficult to interpret than one taken after thoracoplasty

After describing briefly the elaborate apparatus for tomography constructed by the Sanitas Company of Berlin, Dr McDougall said that there were simplifications of the method which were likely to be of equal value Tomographic images could be produced by a relatively simple mechanism The ordinary *x*-ray apparatus might be modified to permit of its use for this purpose, and experience would show that costly apparatus was not necessary At the same time he deprecated the idea that tomography could be carried out by any kind of makeshift or that it was a sort of radiological trick In his device, with the tube above the couch at an angle to the horizontal plane and the film holder below, there was a pendulum arrangement whereby tube and holder moved reciprocally—that is to say, the tube was at one extremity, the film-holder at the other, and when electrical contact was made they both moved in an arc of approximately 45 degrees in opposite directions Such was the apparatus which had been used at Preston Hall during the last twenty-two months, but there were other modifications, in one of which the arc was not used at all the tube moving in a horizontal line parallel with the film-holder, and in another the tube and the body of the patient moved in opposing arcs, the film-holder remaining stationary

He proceeded to show how by tomographic investigation the different features of cases of pulmonary tuberculosis could be brought out The successive appearances at increasing distances from the front of the chest were shown in his films, and he drew particular attention to the elucidation of cavities and cavity formation in general Many cavities in lung tuberculosis, he said, seemed to be pear shaped with the larger end towards the posterior part of the chest Clear information was obtainable by this method of the nature of the cavity wall and the tissues immediately around it, also the relationship of the cavity to the bronchial tree Most important was the clear evidence afforded of separate and distinct cavities in the lung unsuspected so long as the investigation was limited to ordinary radiography The exhibition of his tomograms of lung appearances evoked repeated applause from those present In conclusion Dr McDougall admitted that there were many features in tomography which gave rise to great difficulties in interpretation The method was new, but it seemed likely to be employed more and more in the many branches of radiology as time went on, and it had already extended the boundaries of clinical investigation, especially of the chest

Dr E W TWINING said that this method offered fascinating possibilities to the radiologist Not least valuable was its stimulus to learn anatomy afresh in a three-dimensional way He addressed himself to the study of the air passages by this method, and showed that malignant bronchial obstruction might be diagnosed quite successfully without the use of lipiodol He worked with a very simple home-made attachment, using a lever instead of a pendulum to get the proportional movement between tube and film One of the uses of tomography was to increase the contrast between the object and its surroundings, though it meant some loss of detail In a series of pictures he showed how rapidly the shape of pulmonary abscess cavities appeared to alter as sections were taken One of the major problems was the differentiation between malignant neoplasm and chronic abscess, and here tomography could furnish some useful hints He believed that tomography gave a better chance of investigating the wall of a cavity and the septa than any other method Again, in an obscure case of collapsed lobe of the lung it was possible by this sectional method to follow the vessel shadows into the particular lobe The components of the mediastinum could be sorted out in a way not possible by ordinary radiography He illustrated its use also in bronchial stenosis It was possible to show by tomography the point of narrowing somewhere in the bronchus in malignant disease In Manchester, although the Royal Infirmary was a pioneer in the use of lipiodol there was some reluctance to employ the method of pouring quantities of oil into the bronchi which was always messy and possibly dangerous, and in some bronchial conditions tomography offered an effective substitute, though not, he thought, in bronchiectasis

Dealing with the applications of tomography to other fields, Dr Twining showed how it could bring out the patella much more evidently, also the sterno-clavicular joint Further, it illustrated the topography of the skull The ordinary antero-posterior view of the skull was confused by many overlapping shadows, and a series of tomograms resolved them Particularly well shown was the mass of bone which filled the temporo mandibular joint With the mastoid cells and the petrous bone tomography was not very satisfactory, but in the skull it was of value in bringing out delicate calcifications, and it distinctly showed pineal tumour As cheaper apparatus became available, he believed the method would come into routine use

Dr H C COLYER showed a few films illustrating the use of tomography in chest conditions, and described a slight modification of technique which he had adopted Dr PHILIP ELLMAN suggested that tomography should be useful in certain cases of bronchiectasis, particularly when the heart shadow interfered with the usual view Dr S C SHANKS asked whether there was any experience available of this method in the abdomen, in finding calcified gall-stones for instance, or in intravenous urography Dr GRAHAM HODGSON said that he, as a radiologist, had been filled with enthusiasm for this new method

fuller correlation between the morbid anatomy the clinical picture, and the endoscopic pathology The microscopic sections illustrating the changes in the gastric mucosa could have been more numerous and perhaps a little more clearly reproduced The classification roughly corresponds to Faber's, and comprises superficial, atrophic, and chronic hypertrophic gastritis, with a special division given to post-operative gastritis, a very frequent disease producing more distress than the patient—debilitated no doubt by disease—has the heart to complain of to the well meaning but unduly optimistic surgeon However, unlike some of the German authorities Dr Schindler does admit having seen good results from gastrojejunostomy, and in the absence of severe gastritis even the development of a sphincteric action at the stoma The fact that he finds antral gastritis so much less frequently than the pathologists might be due to the peculiar technical difficulties preventing close inspection of the antrum, which in its distal extremity lies too far from the lens and the light to be examined in detail

The coloured diagrams, though good, fall very far short of the excellence of the originals The bibliography is full and the index well compiled This book is the most valuable contribution to gastroscopy yet published, and no gastroscopist will be without it

EXPERIMENTS ON ANIMALS

The Truth about Vivisection By Sir Leonard Rogers K.C.S.I., LL.D M D F R.C.P F R C S (Pp 182 9 illustrations 5s net) London J and A Churchill Ltd 1937

It is with the detached pleasure of the antiquarian that one reads of the relentless strife and apparently interminable labour of argument that attended the birth of the Darwinian hypothesis It was all most obviously infuriating at the time, but the hypothesis has since then abundantly justified itself and shown itself adaptable to changing knowledge no man asks more of a hypothesis than that The younger medical man of these days has come to view the anti vivisection agitation with a detached interest similar to that which he brings to bear on the opponents of evolutionary theory It is not that he forgets their existence, their pamphlets and their shop window displays effectively prevent that But to-day scientific and medical men of good will almost instinctively approach such phenomena from the standpoint of the psychologist where tout comprendre c est tout pardonner We do most fully understand the painful emotional state of the anti vivisectionists and we realize how bad is the prognosis for their ultimate comfort For it should be remembered that the logical anti vivisectionist (logical that is to say, within the limits of his own pseudo-paranoia) must also be an anti vaccinationist, a vegetarian and an opponent of the germ theory of disease To do them justice many of them are all these things so the anti vivisectionist has much to worry about

The question that must be asked is Has the scientist, the exponent of animal experiment, anything to worry about? If so, then this lucid little handbook is amply justified, for it displays clearly, though necessarily briefly, some of the great structure of achievement both in medical and veterinary science which has resulted from experiments on animals It quotes from the anti vivisection literature to illustrate their arguments and the style of their propaganda and the basis of their anxiety But in none of these need the scientist find much cause for worry It is suggested however, that an anomaly of some importance lies in the fact that it is still permissible in law for bequests to be made to societies whose anti social activities include active opposition to the inoculation against typhoid of troops serving in foreign wars and that in the last war such opposition was influential enough to ensure, in spite of the proven efficacy of such inoculation, that it should not be made compulsory This achievement by the "antis is certainly a striking testimonial to an influence which may have been thought by many to be on the wane It is the influence of money and enthusiasm, and one is to understand from this book that the 'antis have plenty of both these serviceable commodities It is a combination whose possibilities for harm cannot be ignored and which in these days of widespread poverty and emotional imbalance of dictatorships, and of group-movements, may at a crucial time achieve results disastrous to the progress of experimental science Sir Leonard Rogers may, with a clear conscience, say, 'You have been warned'

OBESITY AND ITS TREATMENT

Obesity A Practical Handbook for Physicians By W F Christie M D (Pp 204 16 illustrations 12s 6d) London William Heinemann (Medical Books) Ltd 1937

Medical interest in the problem of obesity lagged behind that of the public, and consequently when patients clamoured for knowledge as to how they should reduce their rotundity the practitioner was only too often at a loss to know what advice to give The opportunity was not overlooked by various purveyors of crank diets with the result that most extraordinary and diverse slimming schemes were adopted, with good, bad, or indifferent results Now that we have somewhat tardily recognized that obesity is a disease which should be treated, articles of value have appeared from time to time in the medical journals, dealing as a rule with the aspect of treatment only

The volume under review has a wider aim Its first part consists of a discussion of the nature of adipose tissue, its storage and the different types of fat found in different situations and their relation to the type of food taken in excess It passes on to a discussion of the causes of obesity, and the author wisely warns against the assumption, so flattering to the patient and not infrequently to the physician, that the trouble is one of endocrine dysfunction The main clinical features of different types of obesity are discussed, and the section on prognosis is worthy of study A section of particular value is that dealing with the calorie expenditure for various common activities, such as moving about in a room talking and so on, and it is extraordinarily interesting to observe in the light of these figures what erroneous ideas many of us have as to the weight reducing properties of different forms of exercise Dr Christie is in agreement with most of those who write with knowledge of this subject that quite a small proportion—in his case 18 per cent—of patients admit to a peculiar liking for taking food in considerable quantities Even allowing for the fact that many gluttons will not admit to gluttony yet there is no doubt that most of those who suffer from obesity have in point of fact a small appetite He points out that the putting on of weight in spite of this is to a large extent the result of the modern tendency to concentrate nourishment into small bulk Thus patients who declare that they only have a small sandwich and a glass of beer for lunch would be surprised to find according to the author, that a sandwich made of cheese and bread, accompanied by a glass of beer produces 530 calories in comparison with a lunch of two slices of roast beef two potatoes half a pound of brussels sprouts and a glass of red wine, which brings up the calorie value to only 460

quarters of a century, and nine members of its present staff have seen over forty years service The brochure sets out many interesting reminiscences of the firm s early work in photography (when "crowned heads and members of the nobility flitted through the showrooms - to receive advice or criticism of their photographic efforts"), x rays, cinematography, and especially, microscopy It was about the eighties of the last century that the serious use of the microscope in medicine and in medical teaching began, and a microscope brought out by Watson s in 1889 found wide acceptance not only in the schools but in the societies of amateur microscopists, which were then springing up all over the country The firm was also a pioneer in camera production before the camera was popularized as it is to day Their detective camera was one of the earliest of the hand cameras, and they also introduced a reflex as far back as 1890 Their work in x rays became so considerable that another company—Watson and Sons (Electro Medical) Ltd—was formed The firm claims to be the first to have demonstrated x-ray apparatus in the London hospitals

Royal Dental Hospital

The Royal Dental Hospital of London held its twenty-eighth annual clinical 'at home' on November 20, followed by the annual dinner of the staff and past and present students In the morning demonstrations were given in the hospital s in-patient department (which is at Charing Cross Hospital), and in the orthodontic department, the conservation room, and the mechanical laboratory Lectures were given on the uses of zinc oxide and oil of cloves in dental surgery by Mr V A F Greenish, and on the construction of radium applicators for lesions in and around the mouth by Mr D G Walker In the afternoon clinical cases, general and orthodontic, were exhibited, including some cases recently treated in the electrotherapeutic department, prosthetic cases were shown in the appliance room, and there were exhibitions of radio grams in the x-ray room and of photomicrographs and drawings in the research department

Mr Frank Coleman presided at the annual dinner, and in proposing the health of the hospital and the dental school briefly sketched its history, which fell, he said, into three periods During its period in Soho Square two outstanding events took place—the formation of the Odontological Society and the granting of a licence in dental surgery by the Royal College of Surgeons—in both of which some of the men associated with the school took a prominent part Afterwards the hospital moved into Leicester Square, close to its present home, and here also two events took place in which the school had its share the passing of the Dentists Act, 1878, and the formation of the British Dental Association The third period, with the hospital and school in its present premises, had again been marked by two events—the Dentists Act, 1921, and the appointment of dental surgeons to schools and in the Services The important scientific event of the first period was the introduction of nitrous oxide gas, of the second the application of x rays to dentistry, and of the third, the realization, thanks mainly to their old friend William Hunter, of the relationship of oral sepsis to general health As for the future of the dental school, this must be largely bound up with amalgamation with a general hospital to consolidate and expand their gains, at the same time the school must not be regarded as a satellite of any general hospital The dean (Mr H Stobie) said that the school greatly regretted the death of Sir John Bland-Sutton, who had been consulting surgeon on its staff for about seventeen years in his place they had been fortunate enough to secure Sir Holburt Waring He also reported the resignation of Dr E W Fish who had given ten years service and who, they were all glad to know was going to continue at St Mary s Hospital his outstanding researches under conditions which the Royal Dental Hospital could not provide He mentioned various other changes which had taken place in the staff, and reported an increase in the number of students entering the hospital and very satisfactory examination results Mr V A F Greenish proposed the health of the guests, who included officers of the British Dental Association, examiners for the Royal College of Surgeons, members of the board of management of the hospital, and representatives of the Army Dental Corps Mr Bryan J Wood, president of the British Dental Association, in responding, spoke particularly of the service of dentists with His Majesty s Forces The conditions of pay and service in the Army and Navy were now regarded as adequate, but this could not be said of the conditions offered in the Royal Air Force and the step had been taken of refusing advertisements of the Air Ministry for officers in that Service A witty speech by Mr A T Pitts in proposing the health of the chairman concluded the evening

Sheffield Hospital Amalgamation

The boards of the Sheffield Royal Hospital and the Sheffield Royal Infirmary on November 17 approved the promotion of a Parliamentary Bill seeking an amalgamation of the two institutions under the title of Royal Sheffield Infirmary and Hospital Mr F W Osborn, chairman of the Royal Hospital board, said that the amalgamation would not interfere with co-operation between all the voluntary hospitals in the area Existing places and equipment would continue to be used so long as they were efficient, but when any buildings became unsuitable they would be replaced by the most modern type of structure on the site of the new hospital Sir Arthur Hall, M D, said that in this matter Sheffield was only doing what had already been done in other large cities

SCOTLAND

Old Edinburgh Hospitals

In the series of Rhind Lectures on Mediaeval Edinburgh, Dr C A Malcolm delivered an address on "Hospitals and Hospices of Mediaeval Edinburgh' The Church, he said, was the chief provider of hospitals, and each monastery had an almoner whose duties included that of seeking out the sick and suffering in the neighbourhood Three abbots of Holyrood had each founded a hospital Abbot Crawford that of St Paul in Leith Wynd, Abbot Bellenden that of St Leonard on a hill in Holyrood Park, and Bishop George Crichton, an ex-abbot of Holyrood, one in Abbeyhill Each collegiate church also had a hospital with a herb garden from which medicines were extracted The town had almshouses, and the Knights Hospitallers had a hospital of St John the Baptist between the Grassmarket and Greyfriars, which was abandoned in 1438 in favour of the Town s Hospital in St Mary s Wynd With regard to the latter, a document had recently been discovered in the General Register House in which it was stated that many of the poor and weak died because of the severe colds in these parts and the lack of hospitality, and therefore the town had decided to build a hospital with twenty-four beds, in each of which two patients could be accommodated The town had been severe in its treatment of lepers, who were isolated in a dwelling outside the town near Calton Persons affected with the plague were obliged to isolate themselves at home, but in 1612 all infected persons were sent to an isolation hospital in the Burgh Muir, a gibbet was erected in the grounds for those who attempted to escape There were also hostels in Edinburgh from the twelfth century belonging to various Scottish abbeys, but these ceased to offer hospitality about 1420 because of the great expenses incurred

Longmore Hospital, Edinburgh

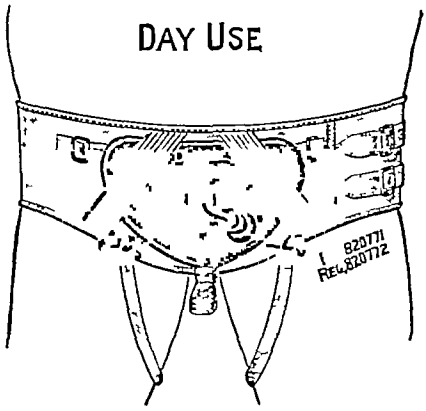
It was stated at the annual meeting of the Longmore and Liberton Hospital that the daily average of in patients during the past year had been 201 Out of 155 applica-

series edited by Professor L Ombrédanne and N Fiessinger, consists of a number of aphorisms essentially clinical in character, dealing with the various forms of acute infectious disease After a few pages devoted to clinical examination and methods of exploration, the author deals with the different types of fever (continued, intermittent, remittent, relapsing and undulant) the various forms of septicaemia, the acute exanthemata, influenza, erysipelas varieties of sore throat, treatment and prophylaxis The work is an excellent introduction to the study of the various forms of acute infectious disease

Dr ANDRÉ HUREZ has contributed a modest monograph *Le Traitement des Broncho-pneumonies Infantiles* to a series on New Therapeutics edited by Professor F Rathery (Paris, J B Ballière et Fils, 16 fr) He summarizes the modern methods available including the oxygen tent, and has included a useful section on preventive measures

Amino Acid and Ammonia Metabolism in Liver Diseases by ESBEN KIRK (Copenhagen Levin and Munksgaard 10 cr) sets out the results of the author's investigation in the form of a degree thesis Hitherto this line of inquiry applied in clinical work has not proved very fruitful and this was possibly due to the use of faulty methods of analysis However Dr Kirk, whose experience in analytical technique is considerable, in applying newer and more reliable methods has not met with much greater success His most important finding is in regard to blood ammonia values, which are enhanced in cases of cirrhosis of the liver and he offers the suggestion that this abnormality is to be attributed to the existence in cirrhosis of a collateral portal circulation short-circuiting the liver In presenting these results in English the author should have sought the assistance of someone with greater command of the language

Preparations and Appliances



APPARATUS FOR BLADDER DRAINAGE

Mr D A. BEATTIE, F R C.S (Bury St. Edmunds) writes

The appliances at present on the market for drainage of the bladder after suprapubic cystostomy leave a good deal to be desired and the apparatus illustrated has been designed with the idea of eliminating these disadvantages It consists of a washable abdominal belt made in cellular material and provided with detachable linen groin straps This belt is made to measure in each case and is provided with a hole for transmission of the catheter Drainage from the bladder is provided by the routine method of a soft rubber catheter inserted through the suprapubic opening and kept in position by a circular rubber shield which itself is held in position by the abdominal belt Attached to the belt are two elastic and webbing straps, which support and carry the detachable rubber reservoir This reservoir unlike the belt is a standard fitting, and is provided with an oval aperture for transmission of the catheter enabling it to be used in every case whether the suprapubic opening is high or low in position The catheter used with the set is somewhat shorter than normal and drains into the reservoir through a special non return valve thus eliminating any chance of a reversal of flow while the patient is lying down The reservoir is provided with a stop cock at its lowest point protected by a rubber shield which prevents soiling of the fingers.

In practice the apparatus has proved extremely successful its greatest asset being that it consists essentially of two separate parts thus enabling the rubber reservoir to be removed for cleaning purposes whilst leaving the catheter and shield held *in situ* by the abdominal belt. The abdominal belt, being an accurate fit to each patient, makes for greatly increased comfort, and is easily washed when it becomes soiled Unlike the usual rubber fitting, which causes excessive sweat production and always feels wet and uncomfortable this belt allows perfect ventilation and actually absorbs any small quantities of discharge which may occasionally flow from the sinus

For night use the reservoir may be detached and the catheter fitted to a night tube which is supplied with the apparatus and which drains into a receptacle beneath the patient's bed Owing to the short catheter used and the curved

design of the rubber guide the apparatus is much flatter than most other types which is a great advantage from the aesthetic point of view

The appliance is named the Pseudo-cyst and has been made for me by Donald Rose 36 George Street Manchester Square London W 1

A DETACHABLE GRIP FOR SPINAL PUNCTURE NEEDLES

Dr F C EVE F R C P (Hull) writes

The handle of the usual lumbar puncture needle is evidently in the wrong place for if it is used as a handle the needle tends to bend or break In practice the operator is obliged to ignore the handle and has to grasp the needle near its point between his thumb and fingers with risk of slipping, bending or bacterial contamination. Hence Messrs Thackray of Leeds have made to my design a little detachable grip (1¼ by 1/2 by 1/4 inches) It resembles a flat mussel shell in being hinged down one side and in gaping slightly open (by a weak spring) A longitudinal groove grasps the needle firmly when the grip is pressed by the fingers The grip is applied at a convenient spot near the needle point, and thus the skin and fascia are pierced without risk of bending or fracture The grip is then released and falls off The needle is now advanced with a gentle probing action Brittle (steel) needles must of course never be used The outer tissues (especially in wasted subjects and in cisterna puncture) may need force enough to bend badly or (one hears) to break a needle

STAPHYLOCOCCAL VACCINE PLASTERS

Histoplast vaccine plasters (Thos Christy and Co Ltd) represent an application of the method of treatment of boils, furuncles, etc which was discovered by Professor Aug. v Wassermann who found that furunculosis was due to the acquisition by the skin of a hypersensitivity towards staphylococci and that insensitivity could be induced in such states by the application of vaccines Histoplast consists of plaster on which a staphylococcal vaccine is embodied in a plaster ointment The manufacturers quote a considerable number of favourable clinical reports on this method

OIL OF AUSTRALIAN TEA-TREE

The Belgravia (brand) antiseptic (Belgravia Chemical Manufacturing Co Ltd) is a preparation containing volatile oil of the Australian tea tree (*Melaleuca alternifolia*) This volatile oil is known to be a powerful antiseptic and to be non irritating.

Correspondence

The Problem of Safe Milk

SIR,—Dr J W P Thompson's exhortation to his colleagues (*Journal* November 20, p 1046) to protect their own households by insisting on the purchase of "safe" milk for domestic consumption might well be reinforced by a broader motive Not mere protection at home but protection also for patients is the doctor's function Indeed, to judge from some recent utterances, it is by preventive methods rather than by curative ambitions that the general practitioner is to justify his continued existence However this may be, it is certain that were every practitioner to make himself an active agent in instructing the public on the dangers of raw milk and on the simple methods by which these dangers can be avoided, a forward step in preventive medicine would be gained

The medical indictment against raw milk is a serious one in reference both to tuberculosis and to acute epidemic disease, and the possession of the knowledge on which this judgement is based imposes a corresponding measure of responsibility, and such responsibility can be discharged only by the conveyance of the relevant information to the public—a task for which the general practitioner has a special opportunity

The need for such education at the present time is urgent, as the intention of the Government is not to control by central legislation the quality of the milk supply, but to place this function at the option of the local health authorities Hence in municipal areas generally it will lie with the representatives of the voters, and indeed with the voters themselves, to say whether this option shall or shall not be exercised Active opposition from the agricultural interest is certain, all the more need therefore for a sustained educational campaign by those whose concern and responsibility is the protection of patients and of the public And here obviously the general practitioner commands the field

The sermon required is a simple one, it needs, however, constant repetition Tuberculin tested milk is attractive, but its supply is limited as the herds to provide it are, and will long be, few in number, in addition, it is relatively expensive, and its guarantee is against tuberculosis only Efficiently pasteurized milk, on the other hand, means both general and particular safety, and this at an economic price, where it cannot be obtained sterilization or boiling may be accepted as a substitute

This simple position is confused in the public mind by various names applied to particular grades or brands of milk, and one of these is the official term "accredited" Naturally the purchaser concludes that milk so labelled possesses all the virtues—cleanliness, purity, safety Yet "accredited" milk cannot profess to be "safe" milk, for it is neither obtained from tuberculin-tested herds nor is it protected by pasteurization or other heat process The intention of the Government is to let each local area settle the quality of its own milk supply Surely it is for the medical profession to see that those who have to make the choice are duly warned and instructed—I am, etc.,

London, W 1, Nov 21 C O HAWTHORNE.

Typhoid Precautions

SIR,—As soon as a medical man, be he medical officer of health or general practitioner, knows that typhoid fever has broken out in his district, he gives urgent instructions to his household, his patients, and his acquaintances to take every precaution—to boil their milk and water, to toast or lightly re-bake the bread, to buy butter and cheese in packets, to avoid ready-cooked cold meats, if salads are eaten, to soak them in chlorinated water before washing them in boiled water, and so on

Why should not the general public have the same early warning and opportunity of escape? The reasons I have been given are

1 Fear of producing a panic Surely panic is born of fear and ignorance Knowledge averts panic And in any case, are we so prone to panic?

2 That if the epidemic is likely to be considerable the source will be found so quickly that the epidemic will be nipped in the bud In the Sydenham epidemic I am informed that the ultimate source was never found though there was sufficient evidence before long to cut out what was probably the distributor In this epidemic one of the late primary cases was that of a mother She died

3 That the business of ice-cream merchants and so on might be adversely affected and who would compensate them if they were found not guilty? If this risk is uninsurable, one has only to think of the thousands of pounds being paid in compensation to farmers in the attempt to stamp out foot-and-mouth disease

It is difficult to believe that so many primary cases would have occurred if the milk had been boiled at Bournemouth, and the water at Croydon, immediately on the notification of, say, the first three cases

Instead of the deplorable secrecy practised by the Ministry of Health I would have flaming publicity, with posters on every hoarding and warnings on every cinema screen I can think of no excuse for sparing every conceivable effort to minimize an epidemic of this dire disease I would suggest that the following instructions should be issued

1 Food should be handled as little as possible
2 Food should be protected from flies
3 The hands should be washed always immediately after using the lavatory (Typhoid germs live in excreta)
4 The hands should always be washed and scrubbed before handling food whether for oneself or for others (During an epidemic a certain number of persons may become infected without suffering.)
5 All milk and water should be boiled
6 Bread and bought cakes, if not wrapped should be baked again lightly or toasted
7 Butter margarine, and cheese should be purchased only in packets
8 All meats except tinned meat, should be cooked at home
9 Bought salads if eaten at all, to be washed thoroughly soaked in weak chlorinated water (Milton may be used) for an hour and washed thoroughly again in boiled water
10 No food to be eaten out of the house unless it is known that all these precautions are being taken conscientiously

—I am, etc,

London, S E 26, Nov 14 W M PENNY

Immunization against Typhoid

SIR,—From reports in the lay press it would appear that the Croydon health authorities are afflicted with the same doubts and anxieties as those which beset many members of the profession in Bournemouth last year I refer particularly to an announcement by the medical officer of health for Croydon advising against inoculation on account of the dangers of the 'negative phase There was so much diversity of opinion here on this subject that I sought and obtained the opinions of a number of authorities in London and at the universities As the replies were in the nature of private letters I do not feel free to quote them, but with one or two exceptions the

BRITISH MEDICAL JOURNAL

SATURDAY NOVEMBER 27 1937

TOMOGRAPHY

The discussion on tomography at the Royal Society of Medicine this week (see p 1088) bore witness to the interest that is being aroused by this new method of radiography, especially in the investigation of pulmonary disease It is well, therefore, to consider the claims made for it and the possibilities of future development. The method conceived by Bocage in 1931 and recently brought to practical realization through the work of Ziedses des Plantes,[1] Grossmann,[2] and Chaoul,[3 4] has the fundamental aim of "focusing" x rays in such a way as to eliminate those superimposed shadows which may make a plain radiograph, even in expert hands, so difficult to read The principle is simple If the *x*-ray tube and the film are coupled together by a pendulum or lever, and caused to move during the exposure in opposite directions, objects within the body situated in the plane of the axis of rotation of the pendulum or lever are sharply defined, while objects in other planes are blurred Those which lie close to the selected plane are the least blurred, those furthest from it are the most blurred By varying the extent of the movement a plane of body tissue of any desired thickness can be investigated In practice effective sharpness is obtained in a stratum of tissue of a few millimetres up to a centimetre or more in thickness The optimum movement for any given purpose is variable, and a wide field exists here for experimental study The only disadvantage of tomography is a slight loss of definition due to blurring caused by structures lying very close to the desired plane, but this is more than offset by the increase in contrast and effective isolation of the structures to be studied

By tomography of the lung Chaoul[3] demonstrated that a cavity invisible in plain films could be clearly seen in the tomogram, its depth and size could be estimated, and the type of the cavity, whether single or multilocular smooth-walled or "ragged" could be determined. Malignant cavitation sometimes showed special characters distinguishing it from that due to other conditions[5] Thoracic surgery, the activity boldness, and scope of which increase from day to day, thus finds ready to its hand an important aid, and in Sauerbruch's clinic tomography is employed for the detection of residual cavities after thoracoplasty apicolysis, and other operative measures Interesting examples of such uses have also been described by McDougall,[6] who was the pioneer of tomography in this country and has applied it in particular to the problems of pulmonary tuberculosis[6 7] The advantages of tomography in diseases of the lung are already manifest, and if no other field were open to it it would have earned a place in our diagnostic equipment. Even in lung radiography its limits are not reached with the investigation of cavities The larynx, trachea, and bronchi are by this means accessible to study without the aid of contrast media Janker[8] has shown neoplasms of the larynx and pharynx in greater detail, and with better contrast, than is possible with the usual "soft-tissue" radiography Canuyt and Gunsett[9] have made tomograms through the larynx in the antero posterior plane which show very clearly the true and false cords, the glottis and the laryngeal ventricles, and display the distortions of these structures caused by laryngeal cancer This appears to us to have very distinct value particularly in demonstrating the downward extent of a laryngeal cancer into the trachea, the degree of which is difficult to estimate by indirect laryngoscopy Twining[10 11] has employed tomography for demonstrating bronchial stenosis and obstruction by carcinoma, and the drainage bronchus in cases of lung abscess When the lung field is completely opaque to ordinary methods a tomogram can show the air tubes, for the gain in contrast obtained by this method enables them to be "dissected out" of the surrounding opacity Bronchiectatic cavities can sometimes be displayed without the assistance of lipiodol, but tomography is in general inferior to lipiodol bronchography for this purpose the latter shows far more abundant and sharper detail The new method has undoubtedly thrown fresh light on those ancient bugbears the hilar shadows Chaoul[3] and Greineder[12] have used it to confirm the observations of Assmann and others on the part played by the pulmonary vessels in the formation of the hilar shadows in their hands it has brought out the arteries and veins in considerable detail, and revealed their relations to one another Sopp[13] has gone a stage further, and in a valuable study of enlarged hilar glands in broncho

the records of cancer research, with its infinitely greater resources, show how much work is necessary before such results can be achieved It is only "little by little" that we shall bring the scourge of rheumatism under control, and years of painstaking labour with little to show will be required Some of the results of the work done at the Devonshire Royal Hospital will be found in the three reports on chronic rheumatic diseases of the British Committee on Chronic Rheumatism, and a full account of all the published work will gladly be supplied to anyone interested on application to the hospital—I am, etc,

Buxton, Nov 20 CHARLES W BUCKLEY

"Cures" in Rheumatic Disease

SIR,—What significance are we justified in attributing to the word "cure" when applied to such notoriously intractable conditions as the chronic rheumatic diseases? It will be conceded generally that actual cure of *many forms of rheumatic disease*—apart from temporary cessation or alleviation of symptoms of variable duration—can, in the present state of our knowledge, scarcely be anticipated, except when the condition is mild in form and in the earliest stages, and when gross structural changes have not yet occurred In most cases *of arthritis, for example, except in mild forms* and in the earlier stages, some degree of permanent damage has been done to the joint structures, particularly the articular cartilage, and although remarkable improvement may be brought about by treatment, it is surely unscientific to use the word "cure' in many of these cases, even if there has been complete cessation of symptoms for a time A careful follow-up system extending over years would doubtless reveal some history of recrudescence of symptoms in many of the cases discharged from clinics or institutions as 'cured'

These perhaps rather platitudinous reflections are prompted by the somewhat reckless manner in which the word 'cure" is used in statistics relating to rheumatic diseases, and *in the mass of literature" that descends* upon most of us not only relating to various remedies, secret or otherwise, and forms of physical apparatus, etc, but also in the form of prospectuses and advertisements of various institutions for the treatment of rheumatic diseases Some of these institutions are not staffed by legally qualified medical practitioners, and in the present unsatisfactory state of the Law it is doubtful whether much can be done to prevent the dissemination of their extravagant and misleading claims and the exploitation of the public I regret to observe, however, that advertisements emanating from certain well-known spas in this country also make use of the word 'cure" in a similar reckless manner *These advertisements emanating from* the lay authorities must assuredly cause grave concern to the distinguished medical men attached to these spas, some of whom are doing such admirable work We often *read of tariff rates for a two or three weeks'* 'cure" At some spas "cure tickets can be obtained covering all treatments and entertainments, and a recent widely distributed spa advertisement claims that 'all sufferers are relieved most are definitely cured"!

The 'cure is often alleged to be due to certain physical or chemical properties of the spa waters Although the internal and external actions of the waters are at long last being investigated scientifically, is it not true to assert that to date the evidence garnered which will satisfy strict scientific scrutiny is meagre in the extreme, and scarcely justifies the confident tone of some spa advertisements? It will probably be argued that the word "cure" *is of long-established* usage for a course of treatment at a spa, irrespective of the result of such treatment May I utter a plea that this misleading term should be abolished, at any rate when applied to courses of treatment for rheumatic disease? The tragedy of disappointment will then be avoided by those members of the public who have suffered for many years from crippling rheumatic disabilities and who really expect a cure and have not the necessary subtlety to interpret the term as synonymous with a "course of treatment"—I am, etc,

London, W 1, Nov 21 A. G TIMBRELL FISHER.

Puerperal Fever in General Practice

SIR,—At a meeting of the Pathological Society of Manchester on November 10 Dr C G Paine of Sheffield gave an address on recent advances in the pathology and treatment of streptococcal infections, based on a fatal case of puerperal sepsis, the aetiology, pathology, and bacteriology of which were fully investigated and the treatment described The aetiology and treatment are of immediate practical importance to the general practitioner, not merely on their own account, but also because of their medico-legal aspects

The patient was attended by a midwife who called in a doctor on account of delay in the second stage, but when he arrived that stage was over and he found a lacerated perineum, which he sutured On the third day the patient was not well, and on the fourth she was so obviously ill that she was sent into hospital, where she died, after surviving the acute septicaemia from embolism due to thrombosis spreading from the pelvic veins to the great veins Haemolytic streptococci were found in her blood and locally Streptococci of exactly the same strain were found in the throats of both doctor and midwife, but not in the throats of her husband and children, though other strains of streptococci were present in their throats too In hospital she was treated with sulphanilamide, and the history and temperature charts suggested very strongly that the treatment pulled her through the acute stage though it failed to prevent the complications which proved fatal.

This case, together with others on record points to the advisability of using sulphanilamide in the same way as we use anti diphtheritic serum—that is, in all suspicious cases and at the earliest possible moment, and particularly before sending a serious case into hospital if that involves a few hours delay In this instance it seems highly probable, though not certain, that the infection passed from the doctor or midwife to the patient, though it might possibly have been the other way round, the patient already having the germs in her throat and conveying them to her attendants In either event the wearing of masks would have tended to prevent the passing of the infection from one to the other Apart from this, is it not possible that a toilet of the throat by drinks, mouth-washes, gargles or sprays might materially diminish the risk of infection? This applies, of course, to all who come near the patient in labour, and not merely to the doctor and midwife To insist on all concerned sterilizing" their mouths and throats would make for safety, and would be decidedly educative An accusation of gross negligence for not wearing masks, for not making any attempt to cleanse the throat, or for not administering sulphanilamide at the first danger signal, could hardly have been substantiated in this case to-day, but when records of similar cases have accumulated someone will find himself attacked, and we do not know how soon that may be—I am, etc,

Bramhall Nov 13 J PRICE WILLIAMS

tions of the war it was noted that the subjects of hypopituitarism did not appreciably lose weight, but their tissues became more watery Indeed, of late the factor of water retention by the obese has received a good deal of attention The whole subject is much more complicated than was formerly supposed, and at present we cannot explain as Dr Levy Simpson says, why of two people with normal metabolic rates and similar food intakes and energy expenditure one may be fat and the other thin

Both the physical and psychological effects of slimming may be harmful in various ways The resistance to pulmonary tuberculosis appears to be lowered Liberal make-up will not successfully hide a haggard, drawn expression nor an irritable disposition Anorexia nervosa may ensue, though it is arguable that here the mental state sometimes induces the desire to slim Nevertheless the impulse to self-starvation not infrequently originates in a girl being teased because she is getting plump However, the sex which for many years injured its health by tight lacing is not likely to be deterred from slimming by such considerations The dictates of fashion will be paramount Women may retort that they try to conform to the prevailing masculine conception of female beauty, indeed, it may well be that both sexes are therefore to blame

THE METABOLISM OF MAGNESIUM

Three papers on magnesium metabolism in health and disease by Tibbetts and Aub[1] are very welcome as up till now but little attention has been given to the part played by this element in man Magnesium is the metallic element in chlorophyll as iron is in haemoglobin but magnesium is important not only in plant life but also in the economy of animals and man[2] All living cells contain magnesium which, like potassium, is present in much higher concentration in the cell than in the surrounding fluids Sodium is more highly concentrated in the latter and the difference in concentration of electrolytes on either side of the semipermeable cell membrane is an important factor in the dynamics of cellular activity If magnesium salts are injected and the concentration of magnesium in the body fluids is raised to the same level as in the cells the animal becomes flaccid and comatose and dies This anaesthetic property is used in the treatment of convulsive states as described in a recent annotation on eclampsia[3] Just as calcium is essential for the clotting of blood and milk so magnesium acts as co-enzyme in the cycle of reactions whereby muscle extracts convert glycogen or starch to lactic acid In spite of the fairly close chemical relation between calcium and magnesium their distribution in body tissues is very different Under normal conditions magnesium tends to be higher than calcium in the cells of soft tissues while calcium is higher than magnesium in extracellular fluids and bones An average diet provides over 300 mg of magnesium a day which is more than enough to maintain the organism in balance[1] Magnesium exchange is not greatly affected by the ingestion of large amounts of phosphate and storage of phosphorus is not necessarily accompanied by retention of magnesium or calcium The excretion of magnesium is increased by the ingestion of ammonium chloride the amount of magnesium put out being such that it can only have been derived from the tissue cells Magnesium ingestion increases calcium elimination but in general there is a surprising lack of parallelism between the metabolism of calcium and magnesium The alterations in magnesium metabolism in hyperparathyroidism are relatively trivial and the addition of magnesium gluconate to the diet does not relieve the drain upon body calcium in fact the reverse is true In exophthalmic goitre and Cushing's syndrome conditions in which the excretion of calcium is increased, and in steatorrhoea, in which calcium is absorbed with difficulty the metabolism of magnesium is normal In Addison's disease magnesium and phosphate excretion are unaffected and calcium elimination somewhat diminished, in spite of the uncontrolled loss of sodium chloride Tibbetts and Aub conclude that the usual assumption that calcium, magnesium, and phosphorus necessarily respond as a group is unjustified These unrelated variations are surprising in view of the rigour with which the electrolytes are maintained at a constant level in the body and it is especially remarkable that two kations so closely related as calcium and magnesium should behave quite independently Differences of behaviour of substances *in vitro* and *in vivo* are, of course an expression of the life and work of the organism We can already explain some of them by overriding hormone control and by processes of esterification which alter diffusion gradients but we are still very ignorant of the way in which the body manages intracellular electrolytes such as potassium and magnesium.

INTERNATIONAL CONTROL OF TRAFFIC IN NARCOTICS

An analytical study of the annual reports furnished by Governments to the League of Nations on the traffic in opium and narcotic drugs provides much interesting information There is clearly a salutary tendency to bring legislation and administration into harmony with the International Conventions of 1912 1925 and 1931 The question of severer penalties has received attention notably in China and the Shanghai International Settlement. In Canada it is claimed that a principal cause of the decrease of opium smoking has been the infliction of a minimum penalty of 6 months imprisonment and a fine of 200 dollars for illegal possession of opium Laws or regulations relating to heroin have been enacted in India and Sweden while in Latvia the use of the drug is prohibited The control of drug addicts has been the subject of legislation in China, Kwantung Leased Terri-

Gastroscopy should never eliminate the radiologist (Henning, Gutzeit, *et al*) but should supplement his findings, as the lesser curve of the antrum, for instance, is better demonstrated by a barium meal Once the instrument is passed the number of failures to examine the stomach is small In three cases out of 216 examinations I failed to obtain a view The introduction is comparatively easy, but the interpretation of this the most difficult of endoscopic methods requires a great deal of experience—I am, etc,

Royal Victoria Infirmary, Newcastle upon Tyne Nov 20 J DUDFIELD ROSE

Disseminated Focal Pneumonia

SIR,—Perhaps if I had stated more clearly in my description of disseminated focal pneumonia that this represents only one variety among the atypical pneumonias, Dr Higgins (*Journal*, November 20, p 1045) would not have been under the misapprehension that this condition is a common one Even in hospital practice (certainly in this hospital) one sees a very large number of the more benign lung inflammations During the past four years I have made careful studies of them in an attempt to make my conception of them more precise

The common type of relatively benign pulmonary involvement following upper respiratory infections described by Dr Higgins has been frequently observed Radiologically many of these cases present a picture which corresponds well to his description of them as 'a patch on the lung"—namely, an ill-defined but localized opacity of fairly homogeneous density This I take to be the condition described by Allen (*Ann int Med*, **10**, 441) as "*acute pneumonitis*"—I am, etc,

Treatment of Psychoneuroses

SIR—Dr Marion E Mackenzie's letter (*Journal*, November 20, p 1046) serves as a model of exposition in plain language of the difficulties which beset the medical man in private practice Thin partitions divide the bounds of the various mental sicknesses classified under the official nomenclature, and not very infrequently it is found that a diagnostic label is attached which embraces only some of the signs and symptoms, but that prejudices the treatment What the patient suffers from—the pathology—and the underlying cause are more important than the name of the disorder

The "conversion hysteria," let it be called, of the stenographer cited by the author is a fair example of a case coming well within the province of the family practitioner to treat, but the general and increasing tendency of to-day is to ticket such cases neuroses and psychoneuroses and straightway pack them off to the psychiatrist, thus at least faintly branding the patient as a "nervous case" with all its damaging implications As a lead in procedure in this class of disorder I quote Mott and Clouston ' The whole class of mental diseases should be regarded and treated, not as local disturbances, but as widespread disturbances of the normal physiological conditions of the whole organism ' Fear, hunger, and love are dominating instincts, and their reactions in behaviour are conditioned by social convention Toxic influence, endocrine unbalance, and metabolic deviation should be ever present in the thoughts of the investigator who attaches importance to biology and biochemistry in the causation and treatment of disease—I am, etc,

Southampton, Nov 21 ARTHUR KING

Obituary

R V DOLBEY, M.S., F.R.C.S

Late Professor of Clinical Surgery, School of Medicine, Cairo

Mr Robert Valentine Dolbey, who died at Chelsworth Hall, Suffolk, on November 13, at the age of 59, was the son of T H. Dolbey, barrister-at-law, and from Dulwich College, where he made his name as an athlete, went to study medicine at the London Hospital He obtained the English Conjoint diplomas in 1902, the M B Lond degree in 1903, the M S (qualifying for the gold medal) in 1905, and the F R C S in the same year He served in the South African war and received the King's medal with five clasps He then went to practise in British Columbia, where he was very successful as a surgeon, but in August, 1914, he left this congenial work to join the Army in France, reaching the rank of temporary major R.A M C, and being twice mentioned in dispatches, he saw war service in Belgium, Tanganyika, and on the Italian front

In 1919 he was appointed to the chair of clinical surgery at the School of Medicine, Cairo, and surgeon to the Kasr-el-Aini Hospital, and the American College of Surgeons paid him the honour of election as one of its Fellows He was also for some years surgeon to the Anglo-American Hospital at Cairo, and during his time in Egypt contributed papers to the *Lancet* on the incidence of cancer and on surgical tuberculosis in that country Tributes have been paid in the *Times* and elsewhere to his fine work for the wounded during the war on various fronts Mr Dolbey wrote two interesting books, *A Regimental Surgeon in War and Prison* and *Sketches of the Campaign in East Africa* He had been a member of the British Medical Association for more than thirty years

We regret to announce the sudden death on November 17 of Dr ARTHUR INGRAM COOKE of Chobham, Surrey He was born in 1881, the second son of the late Rev Frederic Cooke, rector of Westbury, Shropshire, and studied medicine at Gonville and Caius College, Cambridge, graduating B A in the Natural Sciences Tripos of 1902 He then went to St Thomas s Hospital, taking the B Ch degree in 1907, and served as ophthalmic house surgeon and casualty anaesthetist there After proceeding to the M.A. and M B in 1909 he was house-physician to the Brompton Hospital and house surgeon to the Sussex County Hospital and to the Hospital for Women at Brighton He took his M D degree at Cambridge early in 1914 Dr Cooke held a temporary commission in the R A M C during the last two years of the war, and served as eye specialist to the East African Forces He was an accomplished all-round practitioner, deservedly respected by patients and colleagues He joined the British Medical Association in 1911, and was a member of the Woking and District and the Camberley Medical Societies

The death of Miss ANNIE BRUNYATE M.D, occurred on October 13 at High Littleton House, Somersetshire, to which she had removed less than two months previously on her relinquishment, under the age rule, of the post of deputy medical officer of health for the Parts of Lindsey, Lincolnshire She was a scholar of Girton College, and gained honours in the Mathematical Tripos, 1895, proceeding then to the London School of Medicine for Women with an entrance scholarship She graduated M B, B S of the University of Durham in 1902, proceeded M.D in 1905, and four years later took the Cambridge D P H, with distinction in sanitary science Dr Brunyate joined the Lindsey Public Health Department in 1917, and it is significant that the post of deputy M O H. was created for her in 1930, as had been the post

the typical remission and the secondary meningeal phase were of less frequent occurrence The rash and the conjunctivitis occurred in a proportion of the cases Bacteriological and serological examinations were negative and the fact that the blood plasma was still virulent after passage through an L_2 candle suggested that the causative agent was a filterable virus The blood was uniformly infective during the first week of the disease the urine became infective during the second week and remained infective during the early stage of convalescence The cerebrospinal fluid was sometimes infective The virus was neutralized by serum from a patient who had recovered from the experimental disease as well as by the serum of two patients who had suffered from the natural disease one or two years previously The experimental evidence submitted leaves little doubt that the disease is due to a filterable virus How the disease is transmitted from pigs to man is unknown but it is suggested that the louse may be responsible Case to case infection in man does not appear to occur so that infection by the respiratory tract can probably be ruled out. Little seems to be known about the nature of the disease from which the pigs themselves suffer It is said to affect young pigs of 1 to 2 months of age to occur sometimes in epidemic form and to be characterized by convulsions and other nervous symptoms to last about a fortnight and to be accompanied by a very low mortality There seems to be ample scope here for further research

ALLERGY AND IMMUNITY IN TUBERCULOSIS

On the basis of Koch's phenomenon it had been assumed until very recently that allergy in tuberculosis represented a state of the body in which tuberculin hypersensitiveness and immunity to reinfection were always present together and were directly dependent upon each other That the two were dissociable was first shown by Rich in 1929 and later by others who succeeded in desensitizing animals with living avirulent bacilli The animals lost their hypersensitiveness to subcutaneous injection of tubercle bacilli or tuberculin but not the immunity to virulent reinfection Other workers have succeeded in desensitizing animals with tuberculin Pagel[1] has carried the experimental investigation of this subject a step further Guinea pigs were vaccinated with heat-killed tubercle bacilli They developed a hypersensitiveness which was expressed by an immediate though not very intense reaction at the site of subsequent tuberculous infection This immediate reaction was not always associated with protection against tuberculous infection On the other hand protection did occur independently of the quality of the immediate reaction—that is without intense inflammatory response and scab formation When one per cent. peptone broth was used as the excipient of the vaccine in the place of saline protection was often obtained without any immediate hypersensitive reaction after infection Animals "treated with one per cent. peptone broth alone often showed retardation and diminution of the response at the site of infection yet visceral tuberculosis was attenuated and in some animals even failed to develop at all This Pagel regards as a hetero allergic immunity reaction to tuberculous infection That peptone broth can act in a way similar to an antigen in tuberculous animals was shown by the intracutaneous injection into them of peptone broth the local response was quite different from that in normal animals The inflammatory response in tuberculous animals however was diminished (and was identical with that in normal animals) after the animals had been treated with "calcium Sandoz" In tuberculous animals that had been treated with peptone broth previous to infection intracutaneous injection of one per cent peptone broth produced a granulomatous lesion with giant cells after seven days Finally histological examination of the immediate reaction at the site of tuberculous infection in animals vaccinated as above showed evidence of fixation and destruction of the injected tubercle bacilli in the absence of increased inflammatory reaction and necrosis These experiments conclusively prove that hypersensitiveness and immunity in tuberculosis are dissociable phenomena

ASCHHEIM-ZONDEK TEST IN THE DIAGNOSIS OF CEREBRAL TUMOURS

The fact that the Aschheim-Zondek reaction is due to gonadotropic hormones secreted by the anterior pituitary makes it not unreasonable to attempt to utilize it in cases other than pregnancy where the pituitary gland is suspected to be in a state of increased activity Cerebral tumours may therefore *a priori* well be included The investigation of the presence of gonadotropic hormone in the body fluids in such cases necessitates a technique which will detect much smaller quantities than those associated with pregnancy and a standardization of the effects Monnier[1] has recently attempted such a standardization using immature mice and a physiologically standardized extract of human pregnancy urine The effects of different amounts of the gonadotropic hormone were studied in both the immature male and the female mouse In the female the ovaries tubes uterus, and vagina were studied macroscopically and microscopically after injections of 1/4 1/8 1/16 1/32 and 1/64 of a mouse unit as ordinarily defined, the results obtained with the first three doses being characterized as phase Ia Ib and Ic respectively Since the effects of small doses were to be defined Monnier chose as his starting point an amount of hormone (1/4 mouse unit) well below that required for full luteinization or maturation of the follicle but sufficient to indicate an unequivocal pituitary activity Phase Ia in the immature female mouse (resulting from 1/4 mouse unit) is characterized by enormous hypertrophy and hyperaemia of the tubes and uterus visible macroscopically and opening of the vagina Microscopical study of the tissues in phase Ia showed that follicular maturation is too feeble to be used as a criterion On the other hand the intense hyperplasia of the tubes the uterus and the vagina and the keratinization of the vaginal epithelium are unequivocal Doses below 1/4 mouse unit do not in the immature female mouse lead to

LEGACIES TO MEDICAL CHARITIES

BY

HENRY ROBINSON, M D

Chairman of Council Royal Medical Fourdation of Epsom College

The subscription incomes of the medical charities, by which are meant especially the Royal Medical Benevolent Fund and the Royal Medical Foundation of Epsom College, are still far below what they ought to be, although the persistent efforts of the British Medical Association on their behalf have brought about improvements in this respect In what follows, I want first to emphasize that a plea for legacies is not meant to supplant, but to supplement, the prime duty of the profession to subscribe annually

At the Annual Meeting in Belfast last July I was able to give some statistics which I had collected by study of the wills and bequests column of the daily press, and these have now been further analysed My investigation covered a consecutive period of exactly twelve months I took a basic figure of £20 000 and excluded every (medical) estate below that figure It is, of course, clear that a medical testator with no dependants or near relatives who has £10,000 to dispose of owes a much greater obligation to be charitable than one with double that amount who leaves a widow and a large family, but *it is impossible to allow for factors such as this so* the base line was selected on the assumption that all members of the profession possessing property of that value can afford at least a small legacy to one of the charities of their own profession

Before going any further I ought to make two things quite clear first that though the total number of the estates dealt with is surprisingly large it contains only a small fraction of the medical practitioners who die in any one year and secondly, that most of the largest estates which swell the total to imposing dimensions, have obviously and notoriously not been accumulated by successful practice but are the results of non-professional activities or inheritance from ancestors engaged in more lucrative pursuits All the same in my view a qualified medical man (or woman) who is fortunate enough to inherit wealth owes as great a duty to the medical charities both during life and as a testator as one whose prosperity has been the result of professional success I have included in my collection a few estates left by the widows of doctors whenever they have exceeded my datum line

The total number of these estates noted during the twelve months was 115 with roughly a total value before deduction of death duties of £4 978 000 These very considerable figures certainly surprised me and may possibly surprise others but I do not think they can be a freak result (except perhaps by the inclusion of three six-figure estates not acquired in the practice of medicine) because the numbers per month fluctuated remarkably little right through the whole year

It might reasonably have been anticipated that the two medical charities would have benefited very considerably from the wills of these wealthy individuals The Royal Medical Foundation of Epsom College however has in prospect (for it is not yet to hand) but one legacy of £300 from among the whole lot the Royal Medical Benevolent Fund has done rather better with (I think) one good legacy and two or three smaller ones But the grand total can only be described as miserable and unworthy One per cent would have brought in £50 000 which would have put both charities in a position to afford help worthy of a great profession

Another distressing feature of the list is the discovery that few among the larger estate owners have ever subscribed during their lives to either of these medical charities—the cynical will say that is why they left such large fortunes, but probably the real reason is more often thoughtlessness In one case where a medical widower left £52,000 it was discovered on inquiry that the local charities secretary had many times approached him for a subscription and had every time been refused on the ground of insufficient means! A further anomaly is disclosed in a few of the cases where large legacies (sometimes running into several thousands) are left to all sorts of philanthropic organizations, often very deserving ones, without a thought of the claims of our own professional charities For instance not long ago a doctor left about £10,000 among four separate missions to the heathen, he had never subscribed to any of the medical charities Another one, also recently, left some thousands among selected charities, and he too had never contributed to the Royal Medical Benevolent Fund or to the Royal Medical Foundation of Epsom College A woman doctor with no dependants left an estate of £37,000, without a legacy to medical charity, although during her life she had bought and presented to the National Trust a well known beauty spot for preservation in perpetuity She too, appears never to have subscribed to any medical charity during her life

One could multiply instances of similar complete disregard of those claims which might be thought to lie very near the heart of medical testators but perhaps I have said enough I will add just this, that the Council of Epsom College have during the years 1936 and 1937 together sanctioned capital expenditure—in their view, and in my own view necessary expenditure—amounting to about £17 000 and in consequence have to face an exceedingly heavy overdraft from their bankers or else to sell out investments Either expedient will, of course, reduce the income of the Foundation, and this disadvantage could have been avoided if the testators above recorded had taken what appears to me a just view of their responsibilities I present these statistics to the profession in the earnest hope that those who can afford to help the medical charities in this way will not forget or neglect to do so May they live long to enjoy the sensation of knowing that their duty has been done!

R Lévy-Dreyfus (*J Urol méd chir* July 1937, p 5) considers that intestinal fistulae rarely follow operations on the kidney He has been able to trace only fifty five cases in the literature The fistula is caused either by manipulation of the kidney during operation or by the persistence of tuberculous infection or perirenal suppuration In the cases reported tuberculosis was responsible for the largest number of cases, other causes may be lithiasis perinephric suppuration, and neoplasms Fistulae of the colon were most common though there was an almost equal number of duodenal and right colic fistulae The intestinal opening is seldom longer than 1 cm and is often a good deal smaller The first sign of a fistula is the escape of intestinal contents from the wound or scar accompanied by local inflammation and fever This usually occurs in the first few days after operation although cases have been seen when a much longer period has elapsed and one instance is noted where a fistula of the colon was not observed until ten years after the removal of a tuberculous kidney though a sinus had persisted since the operation Fistulae of the colon tend to heal spontaneously and rapidly in about 65 per cent of cases with a gradual decrease of intestinal discharge Surgical treatment may be necessary for those cases in which the fistula does not heal. When the perforation is in the colon an entero-anastomosis followed by a colectomy is the procedure of choice The prognosis in cases of duodenal fistulae is more serious, and operative treatment carries such a high mortality that medical measures should first be tried The most simple form consists in keeping the patient in the ventral or lateral decubitus for a long period, with the reduction of fluids by the mouth

tions will depend on whether we were bred capitalist or communist, Aryan or non Aryan There is nothing new in the idea that reason is not the main guide of human behaviour, but nowadays we have to consider it as a scientific statement, not merely as a satirist s invention to shame us into good behaviour'

This change of outlook favoured Huxley s general conception of brain and mind It was true that the Freudian mechanism was a psychological, not a neural affair, but advancing knowledge of cerebral and mental organization seemed to be leading neurologists and psychologists towards a common ground Both were concerned with the driving forces, whether they were the incentives to intelligent action or physical and chemical factors, which controlled the level of activity in the cortical networks, and both had new methods of attack of great promise Although the neural basis for the simplest intelligent action was not yet certain, a period of rapid progress in cerebral physiology was probably beginning and certainly an understanding of the psychological factors which controlled behaviour was being approached

Practical Results

As to what practical results had followed from this increasing knowledge no one doubted that disorders of the nervous system were better understood and treated than in Huxley s time though there had been no success as yet with disseminated sclerosis and some of the slow degenerations With the psychoneuroses there was certainly more understanding, though it was hard to avoid the impression that there was also more disease In the major disorders of the mind there had been relative failure There were some new empirical treatments with a limited success, and in some cases the prognosis could be given with greater certainty but it must be admitted that an increased understanding of the insane personality had not yet done much to restore it to sanity—so at least it appeared to an onlooker This failure was to be regretted, but it was not surprising The advance had been mainly on the psychological side, and psychological lines of treatment only could be suggested For the psycho neuroses these might be enough but in the psychoses the patient had become inaccessible to such treatment because his thought had ceased to run along the customary lines To restore it would seem to require treatment of the bodily changes which must certainly occur when the mind became incapable of bearing its normal burden

Professor Adrian added that no one need hope for the time when the medical experts would be required to deal with all conduct which was thought by the ruling classes to be anti social There would be quite enough to decide if they were called to breed out abnormalities and obtain a standardized race But it was none the less a logical outcome of Huxley s creed that the biologist should become an expert on human as well as animal behaviour The biologist was still too ignorant to suggest many improvements in the accepted methods by which society controlled its members though lately they had been bold enough to assert that hungry men were often discontented and that prison did not always induce repentance That was perhaps enough at the present stage

Huxley spoke somewhere of biological science as providing an antidote to that phase of despair which the student if he took an earnest interest in social problems would assuredly sooner or later enter The lecturer supposed an occasional phase of despair over the suffering of mankind was still a valuable part of medical training Nowadays not so much comfort could be extracted from the doctrine of evolution or of the survival of the fittest but compensations were not lacking One of these was the knowledge that medical and biological research since Huxley s time had greatly lessened pain and disease another was the more ambitious belief that by research on the brain and on the mind it would be possible eventually to understand and control the forces which determined human behaviour

SOCIETY OF MEDICAL OFFICERS OF HEALTH

THE ANNUAL DINNER

The Society of Medical Officers of Health held its annual dinner at the Piccadilly Hotel on November 18, with the president, Dr JAMES FENTON in the chair Among the principal guests were

Sir Comyns Berkeley (Chairman of the Central Midwives Board) Viscount Dawson of Penn (President of the Royal College of Physicians) Captain G S Elliston M P Lord Horder Sir Kaye Le Fleming (Chairman of Council British Medical Association) the Earl of Limerick Mr Hugh Lett (Master of the Society of Apothecaries) Sir Ewen Maclean (President British College of Obstetricians and Gynaecologists) Sir John Parsons (President Royal Society of Medicine) Sir Allan Powell (Mayor of Kensington) and Lord Snell (Chairman of the London County Council)

Mr R H BERNAYS M P (Parliamentary Secretary Ministry of Health), proposing the toast of The Society said that it was largely to the medical officers of health that the country owed the splendid public services now available for the prevention and cure of disease In many areas, especially rural, full advantage was not taken of the services, and the Ministry was at present concerned with securing a better use of existing facilities There were hundreds if not thousands of pregnant women at the present moment who had not sought, and did not realize why they should seek medical care before their confinement He added that he was sure the local health arrangements were at their best and most fruitful when there was full and friendly co-operation between the local authorities as represented by their medical officers of health and the general practitioners of the area The national health campaign was the beginning and not the end of the matter for health education must be continuous if it was to be successful He had been specially instructed by the Minister (Sir Kingsley Wood) to invite the individual co-operation of all in the medical profession in the health campaign and to express his gratitude for what had already been done

Dr JAMES FENTON in responding said that medical officers of health were grateful to private practitioners for the spirit of co-operation they had shown in the campaign The maternity and child welfare tuberculosis and other services were now firmly established, and the outstanding problem was to teach people to take the fullest advantage of them He went on to suggest that the municipal hospitals should be made use of for research into the causes and prevention of the two maladies which took a heavy toll of life health, and comfort and the origins of which were still obscure—namely, cancer and rheumatism—but he agreed that hospital research was not enough it must in some way be combined with research among the general body of the people in their homes and work places He reminded the gathering that those who had gone before them had not been afraid to tackle difficulties and by their labours they had enabled the present generation to prevent what seemed in their day as unpreventable as cancer in our own How would posterity look upon us if we did no more than polish the monuments chiselled by our forefathers?

The Positive Element in H alth

Captain G S ELLISTON M P., proposed the health of the guests in a comprehensive speech coupling the toast with the names of Lord Horder and Lord Snell

Lord HORDER said that it was necessary to concentrate upon the positive element in health rather than on the negative absence of disease This was of fundamental importance to-day not only in the work of medical officers of health and general practitioners but in that of consultants and specialists This positive element was

anything which stood for a mental experience Symptoms often called rheumatic might be symbols of deep seated emotional attitudes

The psychological approach, Dr Halliday concluded was neither muddle headed nor mystic but scientific and practical Its employment meant that a sense of proportion and perspective was achieved By the use of a simple psychological technique observations might be made which were relevant to the aetiology treatment, and prevention of much incapacity and illness which was labelled in practice and in statistics under the comprehensive term non arthritic rheumatism This would not be believed or accepted until students of rheumatism made the necessary effort to become acquainted with such technique and applied it for themselves in daily practice

Psychological Background of Organic Disability

Dr R G GORDON said that Dr Halliday had spoken of cases which were not properly those of rheumatism at all but should have been diagnosed as hysteria or other form of psychoneurosis He himself proposed to speak about the psychological approach to those patients who actually had rheumatic disease Unless the psychological factors which might be concerned in the history of these patients were kept in mind there would be no real success in curing or understanding the condition Many people suffered from a certain degree of organic disease which they used in order to achieve an object often very satisfactorily from their point of view because nobody could deny that the disease was present An obvious example was afforded by compensation cases in which a man naturally tended to cling to his compensation so long as he was uncertain of his earning capacity Disappointment in love was another example The rheumatic disease or other trouble tended to persist until the individual was persuaded to make some readjustment to life A most common group of rheumatic cases were in people of middle or even late middle life who had some chronic condition and used this to excuse further effort or to obtain sympathy from their friends He instanced the hunting man who had a mild osteo-arthritis of the hip was persuaded that he was never going to hunt again and went limping and groaning around the health resorts It required a skilled and persuasive physician with psychological knowledge to get such persons out of that condition The temptation to tell the patient that he had got some disease with a high sounding name seemed to beset some members of the profession and to yield to it was not very creditable It was equally wrong to suppose the pain to be imaginary The effect of the emotional stress was to sensitize the thalamic centres where pain was felt The cortical control over these centres was diverted by the emotional condition and a neural habit was formed in which the pain became habitual and was a real pain to the patient What had to be done was to remove the fibrositis which might be the original cause but the main part was to desensitize the thalamic centres by straightening out the emotional condition and in such cases wise though it might be very simple psychotherapy was enormously effective Dr Gordon emphasized that it did not follow that the physical side should be neglected Attention to the physical side might be a means of gaining the patient's confidence so that what the psychologist called 'transference' took place

In many conditions of illness (Dr Gordon added) the soil on which the illness developed was psychogenic The valuable work of the old physicians who paid such attention to the soil was apt to be forgotten In a case of rheumatoid arthritis for example, the immediate past history might reveal a bereavement or a fright as a result of which there was produced the soil wherein the organism found lodging It might further induce autonomic changes and the balance of the endocrine organs might be upset All these cases required treatment but it was a wise physician who, in establishing treatment, could take every aspect of his patient into account and sometimes confess his own inability to carry out treatment effectively The spa physician might discharge a useful function in these cases studying and sorting out the factors and sending the patient back to the experts, who would carry out the necessary treatment

Dr S D MITCHELL related particulars of an examination carried out by Dr Philip Ellman and himself into forty cases of rheumatoid arthritis and forty cases of osteo arthritis in which the personal factors relating to the history and behaviour of each individual were studied The results which had been already published showed, among other things a high percentage of morbid anxiety among the rheumatoid arthritics Dr KERR PRINGLE pointed out one disadvantage of institutional treatment—that these people got together and by talking over their symptoms magnified them Dr F D HOWITT said that many doctors were too much inclined to pigeon hole their rheumatic cases and apply treatment according to categories rather than according to the merits of each case It was well known in treating a primary atrophic type of rheumatism how largely emotional factors and home environment entered into causation and prevented recovery

MATERNITY WORK IN L.C.C. HOSPITALS

At a meeting of the Section of Obstetrics and Gynaecology of the Royal Society of Medicine on November 19 Dr LETITIA FAIRFIELD presented a survey of maternity work in London County Council Hospitals during the years 1931 to 1936

Dr Fairfield pointed out that the conditions in the municipal hospitals were of interest as an increasing proportion of the midwifery of the county was conducted within their walls Of the 58,130 births in London last year 18,261 took place in L.C.C. hospitals The number of beds had increased during the period from 600 to 853 while the maternity units had been reduced from twenty-six to twenty two The optimum size of unit was now considered to be from eighty to ninety beds Of the women confined 46·5 per cent were primiparae 8·7 per cent were unmarried Although no compulsion could be exercised 90·88 per cent attended the Council's ante natal clinics The rate for aided or complicated labours remained steadily at about 16 per cent The stillbirth rate was 3·8 per cent., and the death rate of infants within the first ten days of life 1·9 per cent Caesarean sections constituted 0·85 per cent of the deliveries the forceps rate was steadily between 3·25 and 3·39 per cent the surgical induction rate was 2·47 per cent (mainly owing to the practice of one or two hospitals)

Puerperal Sepsis

It was difficult to secure really comparable figures for the maternal mortality rate The deaths from truly obstetric causes after the twenty-eighth week were presented separately The total had been 292 out of 79,254 confinements the rate had fallen by 50 per cent between 1931 and 1936 and was at least 20 per cent lower for 1937 Puerperal sepsis with ninety five deaths was the major problem Cases of sepsis from the hospital standpoint fell into four groups autogenous epidemic sporadic cases after normal labour and sporadic cases after abnormal labour Only the last group now contributed to the Council's death rate Two factors had revolutionized the outlook for such cases The first was the intensive work of Dr Leonard Colebrook and his colleagues in regard to the haemolytic streptococcus and the second the discovery of prontosil though this latter advance came too late to influence favourably the statistics she was presenting Only three patients had been lost from infection since prontosil was used and of these two had been infected before coming into hospital and were seriously ill on arrival She insisted that it was possible to concen

moment, without any other radical treatment An extensive cavernous naevus of the nose eyebrows and lips had necessitated after radium treatment upper and lower pedicle grafts together with inclusion of various borrowed bits of cartilage

Sir Harold Gillies stressed the importance of recognizing the improvement in mental attitude that was coincident with the disappearance of disfigurement A girl who had suffered the loss of the scalp in a factory accident and for whom repair had been effected by a double pedicle graft—from abdomen to arm and then from arm to forehead—was enabled to wear a toupée, which gave her a normal appearance she had subsequently married Similar grafting had proved effective after excision of deep scarring of the face secondary to burns Amputation of a lower extremity had been rendered unnecessary in the case of a middle aged woman the victim of a severe motor car accident by effecting a very difficult repair with a pedicle flap from the abdomen In the case of a severe x ray dermatitis affecting the arm of a radiologist excision of the diseased area had been the means not only of removing pain but also of restoring useful function to the limb

Buccal Deformities

In dealing with buccal conditions skin grafts maintained in position by pressure moulds of the cavity gave excellent results, and it was surprising to note the rapidity with which healing took place An appropriate and exact moulding of dentures was a *sine qua non* when repairs to the mouth and chin were undertaken In syphilis there had seemed to be reluctance to attempt to correct deformities in the past but once the disease had responded to specific treatment he saw no reason for such reluctance

Syphilitic ulceration destroyed the mucous membrane of the nose and so skin grafting was required for lining the nares in addition bone grafting and a suitable dental appliance had done much to improve the appearance in certain cases

Sir Harold gave a short account of the modern developments in the treatment of congenital malformations—for instance hare-lip where the muscles were now united in separate layers and building carried out in stages without hurry Allusion was made also to Abbé's operation for repair of double hare lip He discussed the difficulties associated with hypospadias and other congenital defects of the penis and urethra In one such case he had removed the umbilicus and grafted it on to the tip of the penis thereby reproducing at one and the same time a normal appearance and a patent urethral opening In congenital webbing of the fingers pressure skin grafting had proved satisfactory In flattening connected with frontal sinus defects and in hemiatrophy of the face flat grafts had given perfect results The best grafts for this purpose were obtained from the abdomen in particular the right iliac fossa

He mentioned the difficulties met with in treating congenital absence of the ear at the moment six out of ten cases in which he had obtained cartilage from the mother had given very good results The chief difficulty was with the construction of the upper part of the ear

Deformities due to Facial Paresis

Sir Harold Gillies ended his address with a cinematograph demonstration of his operation for correcting the deformity resulting from unilateral facial paralysis The first step in the operation was the acquisition of strips of fascia lata and their accurate division in length and breadth Next followed the subcutaneous insertion of appropriate strips in circular fashion through the musculature of both lips A similar fascial graft was then attached to a slip of innervated temporal muscle obtained by inversion and brought down over the zygoma The free end of the lower fascial strip was brought up subcutaneously and tied to the temporal slip in the small wound below the zygoma—a trifling scar alone being visible after the closure As an immediate result of this operation biting was practically normal smiling and whistling brought out no harsh asymmetry of the face and lips and emotional responses—extreme hilarity—showed only 50 per cent of the preoperative deformity

ORGAN INFERIORITY

At a meeting of the Medical Society of Individual Psychology on November 11 Dr CUTHBERT DUKES read a paper on organ inferiority, this being the second of four papers forming a symposium on the contribution of the late Alfred Adler to psychological medicine

In his introductory remarks Dr Dukes explained that his paper was short and intended to be provocative of discussion Adler's *Study of Organ Inferiority and its Psychical Compensation* published in 1907 marked the beginning of his career as a psychologist and might be said to have laid the foundation of individual psychology The book dealt with two subjects The first and simplest was the influence of an inferiority or defect in an organ as a determinant of disease For example tuberculosis was more likely to develop in a defective than in a normal organ and Adler argued that when we could find no other explanation for such a localized lesion as renal tuberculosis we might assume that the kidney itself was inferior Dr Dukes criticized Adler's statement that such an inferiority might be of a fundamental character affecting the whole urinary tract and might manifest itself in one patient by a structural deformity in another as renal tuberculosis calculus or tumour and in another as some such functional difficulty as enuresis He challenged Adler's statement that there might also be segmental inferiorities and inferiorities dependent on groups of physical characters affecting wide areas of the body and leading to defects in the height size or weight of the whole body He had never come across much evidence for an inferior state of a whole organ system or segment of the body manifesting itself in different but related ways in different members of one family But he was a firm believer in the inheritance and therefore in the familial distribution of a defect or inferiority of one particular organ The example of which he had had most experience was intestinal polyposis or multiple adenomata of the large intestine This was obviously an inherited organ inferiority The small tumours usually appeared in childhood and were at first benign but early in adult life carcinoma of the colon or rectum was a probability Here was an example of an organ inferiority acting as a determining agent in disease and recent cancer research had brought to light similar examples of inferior organs predisposing to malignant disease in animals By inbreeding it was possible to rear strains of mice with such hereditary predisposition to cancer of the liver or to cancer of the mammary gland Thirty years ago Adler said It is the inferiority of the organ and not the cancer which is inherited

Psychological Effects

The second and larger subject with which the book dealt was the effect of organ inferiorities on the psychological development of a child An inferior organ might become the centre of attention of the developing personality, and the whole plan of life might be arranged to disguise to counterbalance or to compensate for the deficiency Examples were given of the effects of such an inferiority as a defect of speech This might lead to great concentration either to overcome or to conceal the defect, so that the afflicted individual might become an orator, or a stammerer, or a recluse Thus it was not the gravity of the disease but the child's personal attitude to it which was psychologically important A serious disease might have no special importance so far as mental development was concerned A slight defect, harmless in itself but troublesome or deforming, might severely shake the courage and

Dr TWINING in reply to the above questions said that by tomography the fact of bronchiectasis could be established and it could be ascertained which lobe it was in but when it came to saying what kind of bronchiectasis it was lipiodol had the advantage every time He had not used it for cholecystography, detail must be shown in the gall bladder and contrast was already pretty good but tomography, while it heightened contrast lost some detail

In reply to a further question Dr MCDOUGALL said that now that the gross chest conditions had been explored it was proposed at Preston Hall to make an intensive investigation of sputum positive cases with minimum radiological signs

ACUTE RHEUMATIC FEVER

At a meeting of the London Association of the Medical Women's Federation on October 25, with the president, Miss E C LEWIS in the chair Professor J W MCNEE gave an address on acute rheumatic fever

Professor McNee said that since returning to Glasgow he had been impressed with the frequency and severity of the acute rheumatic diseases in Glasgow as compared with London He referred particularly to cases of acute rheumatism seen in the early spring of 1937 especially in adults and adolescents He discussed the features and possible aetiological relationship between three different types (1) ordinary acute rheumatic fever (2) chorea and (3) an illness starting with the usual phenomena of acute rheumatic fever but running on directly into the typical picture of rheumatoid arthritis He spoke of the clinical severity of the first type the striking effects of salicylates on the fever and general symptomatology, and the marked tendency to relapse if the heavy dosage of salicylates was relaxed too soon In the second type he denied that chorea only affected alert and nervous people the dull and apparently unemotional factory girl seemed just as susceptible The third type of case was important in relation to the problem of the aetiological connexion between acute rheumatism and rheumatoid arthritis These cases when seen in adolescents were not cases of Still's disease—there was never enlargement of lymph glands or spleen

Endocarditis occurred in all three groups but this was not proof of a direct aetiological connexion between the groups An exactly similar endocarditis might occur in other and quite different diseases He had seriously begun to wonder if the acute rheumatic diseases especially rheumatic fever and chorea represented any true clinical and infective entity—his faith in these things had been shaken by the recent developments in the knowledge of scarlet fever Perhaps the Aschoff body was the sole clue available at present but was that a lesion caused by a specific virus, or merely the reaction round a small area of necrosis due to various infective or toxic agents? Were Aschoff bodies to be found constantly in chorea or in the third type of case referred to? It was difficult to interpret the epidemiological facts about acute rheumatic disease that were already known It was usually a seasonal disease in Britain having its greatest incidence in November, but it had been common this year in early spring He was impressed as was Thompson in Birmingham with the number of patients who told of damp houses and of residence near a river It was difficult to suggest any influence due to diet—the disease did not seem specially to attack those in the extremest poverty and squalor but often those who had been well described as the decent poor Professor McNee concluded by saying that none of the hypotheses of aetiology—streptococci allergy or filterable virus—was at all convincing Work on all of the three types he had described must be continued in the centres where the rheumatic diseases were particularly prevalent, and Glasgow certainly appeared to be in this category

Local News

ENGLAND AND WALES

Tuberculosis in Wales

Reference is made in the twenty fifth annual report of the King Edward VII Welsh National Memorial Association which covers the year ended March 31 1937 to the conference at Shrewsbury last December, when details of a more intensive campaign against tuberculosis mortality were approved, it being admitted that the provision hitherto made by the Memorial Association had been inadequate in some respects It was decided that the Association acting as agents of the local sanitary authorities should assume responsibility throughout Wales for obtaining and recording the basic data concerning patients should carry out certain preventive measures and act more decidedly as regards discovered housing and sanitary defects With the co operation of insurance committees and approved societies there should be a tightening up of the practice of notification and reference to tuberculosis officers panel practitioners being circularized and greater emphasis being placed on the necessity for prompt reference of suspected cases among insured patients to regional medical officers preparatory to enlisting the help of tuberculosis officers The attention of the Welsh Board of Health should be drawn to the laxity in certain quarters in the notification of tuberculosis the transmission of notifications from district medical officers of health to county medical officers and the correction of housing and sanitary defects This conference was followed by another in February of this year when an adjusted financial estimate was approved and by a third in March when opposition was manifested to the proposals of the Memorial Association a deputation of which subsequently met the Minister of Health and its programme was reiterated The council of the Association deprecated the fact that the progressive and ordered development of the plan for the National Campaign against tuberculosis in Wales had been most unfairly interrupted. The report states that the total number of deaths from all forms of tuberculosis in Wales and Monmouthshire during 1936 represented a rate of 0 816 per 1 000 as compared with 0 925 in the previous year and with the rates for 1936 of 0 692 in England and Wales together and 0 681 in England The hope is expressed that this gratifying decrease in mortality will be more than maintained in future years Emphasis is laid on the danger of exposure to open cases in overcrowded homes especially in conjunction with under nourishment and dietetic defects, and it is suggested that good might be done by freeing children temporarily from adverse home conditions There is still a serious shortage of laboratory accommodation and research work is retarded by the pressure of routine investigations Surgical blocks for the treatment of cases of chronic tuberculosis as a part of the ordinary surgical tuberculosis hospital are advocated by Dr Alexander Brownlee it being impracticable to treat these patients adequately in their own homes and uneconomical to deal with them in the general wards of these institutions

An Optical Centenary

Not to many firms is it given to celebrate a hundredth anniversary or at least to have been carried on for that length of time by members of the same family and the fact that W. Watson and Sons Ltd of High Holborn, London makers of microscopes and other optical instruments, have achieved that record well deserves the production of an interesting brochure to commemorate the event The firm was founded in 1837 by William Watson and a son a grandson and a great-grandson of the founder are directors of the firm at the present day It has had its present address in High Holborn for three

tions for admission during 1937 sixty six were from persons suffering from cancer, of whom forty nine were admitted The pressure on the accommodation for female patients suffering from this disease has given the managers much concern and more beds had been made available for them Finance had, on the whole been satisfactory, although the ordinary income did not meet the ordinary expenditure, and year by year a deficit had to be met out of donations and legacies received This year the deficiency had amounted to £3,220, the ordinary expenditure having been £18,000

SOUTH AFRICA

Overcrowding in Mental Hospitals

The report (1936-7) of the Mental Hospitals Departmental Committee South Africa, discloses a lamentable condition of affairs It is stated that the number of patients resident in institutions is far in excess of the accommodation available Only in the case of European males does the accommodation appear to be in any way adequate European females and native patients of both sexes are sadly overcrowded Even among Europeans the beds are in some cases so close together and passage through dormitories is so hindered by extra beds, that in a recent instance a patient was murdered by one of his fellows before it was possible for the attendants to intervene Native patients were found to be sleeping in absolute contact with one another forming a solid layer of humanity, so that it was scarcely possible to pass through the wards Available accommodation for patients is further reduced by the lack of adequate quarters for the European staff who are too often accommodated in rooms intended for patients Some of these unfortunate nurses occupy single rooms' measuring about seven feet by nine, with armoured doors and guarded windows These rooms are, in effect, cells intended for noisy dirty, or refractory patients The hardship is accentuated in the case of night nurses who on account of the close proximity of these quarters to the patients day rooms, are unable to secure their proper rest The report states that the committee, after careful inspection of all the hospitals and institutions, decided that the accommodation provided is frequently of such a nature as to be detrimental not only to the recovery but also to the actual well being of the patients It is further stated that as long ago as 1913 a Select Committee found the accommodation provided to be both inadequate and unsatisfactory Improvements and additions since that time have not merely failed to keep pace with increased requirements but in some instances have been insufficient *even to overtake the needs which then existed* This prevalent overcrowding which makes impossible the separation of the noisy from the tranquil the dirty from the clean, the maniacal from the harmless creates, in the opinion of the committee an obstacle to recovery which cannot be overcome by any conceivable method of therapy Following a large number of general recommendations by the committee the report states that the whole administrative machinery of the Mental Hygiene Branch of the Department of the Interior is fundamentally defective and a strong conviction is expressed that it should be transferred to the Department of Public Health as an autonomous subdepartment The formation of an advisory board or council similar to the Leprosy Council, is also advocated

Health of Capetown

The report for 1936 of the medical officer of health for the city of Capetown records a serious epidemic of whooping-cough during the year under review The number of deaths reported was 188 the majority being of non European children under 5 years It is stated that the non European death rate from whooping-cough per 1,000 children living was eight times as great as the European in children under 1 year and ten times in children between 1 and 2 years There is no reduction in the mortality from tuberculosis which is a major problem for the health authorities Among the white population the death rate *from this disease is twice as great as that of the Union* as a whole and exceeds that of England and Wales In non Europeans the position is much worse the tuberculosis mortality being five times as great as in Europeans This unfortunate state of affairs is attributed to low social and economic conditions prevalent among the coloured people and also in the poorest sections of the whites Overcrowding, bad housing, and malnutrition are contributory factors which can only be improved by measures of social reform The provision of clinics, hospitals and sanatoria is also inadequate and although a considerable increase in the expenditure on tuberculosis services is foreshadowed still further extensions the report states will be necessary The non European section of the population of Capetown constitutes approximately one half of the city s 300 000 inhabitants The greater part are of mixed race, with a definite admixture of white blood known as ' Cape Coloured These people are largely the descendants of slaves, whose emancipation was completed in 1835 Their ancestors of the eighteenth century and earlier comprised Europeans, Hottentots blacks from Mozambique Madagascar *and other parts of Africa and East Indians* from the Dutch East Indies One section of the Cape Coloured known as Malays is Moslem in religion, and more immediately descended from natives of the Dutch East Indies These Malays " tend to intermarry with Moslems from British India who are comparatively newcomers The Cape Coloured also include a small proportion of Bantu natives Among all these people the principle of compulsory education is not applicable As a result there is much illiteracy In addition to ignorance a lack of discipline tends to produce a high incidence of venereal disease and alcoholism Although the bulk of the city consists of houses of brick or stone served by water carriage sewerage and a good municipal water supply some thousands of non-Europeans live in wood and iron shacks on the outskirts In these outlying districts stercus is collected weekly in pail closets by mule or ox wagons under the control of the city engineer s department, and removed to trenches in municipal land where it is buried This work presents considerable difficulty, especially in the flat sandy region known as the Cape Flats, owing to lack of roads soft soil and standing water in winter It is stated that more than 5 000 premises were dependent on this form of sewage removal in June, 1936

A Caeiro and O Orias (*Rev argent Cardiol* May–June 1937) after recording optically the heart sounds at the apex mesocardial and pulmonary areas simultaneously with the jugular pulse in twenty healthy young medical students came to the following conclusions An auricular sound at about 29 vibrations per second was recorded in 85 per cent of cases lasting for about 0 1 second, appearing in the records with an amplitude of 6 mm, about 0 015 second after the beginning of wave A of the venous pulse and from 0 034 to 0 046 second after the top of the *P*-wave in the electrocardiogram The first heart sound was found to be composed of four groups of vibrations the first consisting of one vibration the second of one and a half vibrations and the third and fourth of two vibrations each The second sound showed a frequency of 36 vibrations per second all over the praecordial area but was recorded with maximal amplitude in the mesocardiac area The so-called third heart sound was recorded in 65 per cent of the cases the average figures for its properties being as follows duration at apex—0 117 second mesocardiac region—0 136 second and base—0 092 second, number of vibrations per second at apex—3 7, mesocardiac region—34 and base—33

general consensus of opinion was to the effect that inoculation was definitely indicated and that the risk of a 'negative phase" could be ignored At the Royal Victoria Hospital where some forty odd cases of typhoid were treated, all the nurses were inoculated and no case of typhoid occurred among them

In a recent report by Dr R Taylor in the *Journal* (October 16, p 760) on the treatment of an outbreak of typhoid among the Spanish refugees in England, the camp medical commandant mentions his own initial doubts as to the advisability of inoculation *in the presence of an epidemic* Like us he was unable to find an authoritative statement on the subject in any textbook He decided to inoculate all the children, and although the hygienic conditions were bad owing to the children's unfortunate habits nevertheless the epidemic was quickly stamped out and there were no instances of severe attacks of typhoid occurring during the negative phase' One hopes that by the time this appears in print the Croydon outbreak will have been arrested, but in view of the doubts which have assailed the minds of doctors in three separate epidemics it seems worth while ventilating this problem

I cannot resist this opportunity to express the hope that the Lister Institute's serum should be given a trial in the present epidemic Our experience here led us to hope that given early and in full doses, it may prove a most valuable method of treatment—I am, etc.,

Bournemouth Nov 22 R VAUGHAN FACEY

*** According to the *Times* of November 23, anti typhoid serum has been obtained from the Lister Institute by the Croydon Public Health Department and supplied to local doctors for use in fighting the outbreak Commenting on the use of serum in an annotation in the *Journal* of November 20 (p 1029) we said The method is at least worth a trial for selected individuals where the risk of infection is high in the hope that the severity of attack may be mitigated even although complete protection may not be conferred Referring to the other point raised by Dr Facey the value of prophylactic inoculation, we said that this might be employed with reasonable expectation of success in protracted or widespread outbreaks and is indeed the only effective measure if the source of the infection is not detected or completely eradicated We would refer readers interested in the serum treatment of typhoid to the article by Dr Harold Cookson and Dr R V Facey in the *Journal* of May 15 1937—ED *B.M.J*

Oysters and Typhoid

SIR—In at least two recent cases persons who had contracted typhoid fever after eating oysters in restaurants obtained damages from the proprietors of the restaurants concerned In the second case the legal advisers of the restaurateur apparently thinking their case to be hopeless settled the case out of court after the evidence of the plaintiff had been heard In both cases the wholesalers and oyster fishing companies implicated emerged scathless The reasons for this are not at all clear to me In each case great stress was laid on evidence suggesting that the oysters were stale but surely nobody believes that staleness can produce *B typhosus* It can be alleged with what measure of truth I do not know that a stale oyster allows *B typhosus* to multiply or to acquire virulence, but that suggestion should not tell against the restaurateur who has no means of ascertaining that he has been supplied with a potentially dangerous article As no evidence was given that any member of the restaurant staffs was a typhoid carrier, it must be presumed that either the oysters were already infected with the *B typhosus* when caught (in which case the fishing company might perhaps be held to be blameworthy), or in fact the oysters had nothing to do with the typhoid I can see no reason for finding against the restaurants Perhaps somebody can tell me where my reasoning has gone astray—I am, etc,

London W 9 Nov 14 JAMES GOSSIP

Research in Rheumatism

SIR,—To dispute priority is I admit, the confession of mental feebleness, but Sir Leonard Hill (*Journal* November 20 p 1045) is strangely wrong The first rheumatism research unit was founded by myself at St Mary's Hospital in 1897 It was then a real unit—namely, one man or, as the dictionary has it a single thing or person Soon before 1900 it became two people, and then fell into line with the modern unit which suggests to a mere countryman great horses straining at the plough but is in fact more like a limpid stream running through a lordly but expensive and aristocratic property Whether this unit has done valuable research it is not for me to say Certainly some of the work has been re-done as original in this country—which is always consoling—and certainly the art of drawing the tonsils became more popular after 1900 I would remind Sir Leonard Hill that *Researches on Rheumatism* a collection of papers, was published in 1913 about a quarter of a century ago —I am etc.,

Bath Nov 20 F JOHN POYNTON

SIR,—In the report in the *Journal* (November 20, p 1042) of the laying of the foundation stone of the new "arthritis unit at the Hospital of St John and St Elizabeth by Sir Kingsley Wood it is stated that the arthritis unit in question is the second of its kind to be established in this country From a letter in the same issue from Sir Leonard Hill it would appear that the first was established by the London County Council at St Stephen's Hospital in connexion with the St John Clinic Much may depend upon what is meant by an arthritis unit but if it means a hospital ward for cases of arthritis associated with a laboratory for bacteriological and other investigations I think it must be emphasized that so far from these being the earliest attempts to investigate rheumatic disease in hospital and laboratory combined they are distinctly late in the field

The Devonshire Royal Hospital in Buxton which treats about 4 000 cases of rheumatic disease every year nearly half of them being cases of arthritis of one type or other established a laboratory and appointed a bacteriologist in 1912 This should I think be regarded as the first arthritis unit in this country In 1923 with the help of an annual contribution of £250 from the corporation a research chemist was appointed and another laboratory equipped So far as I am aware this was the earliest instance of research into rheumatism being assisted by a municipality the London County Council being second in the field At the present time the Devonshire Royal Hospital has a bacteriologist a research chemist a radiographer and two laboratory assistants engaged in research work although that of necessity includes an enormous amount of routine investigation The work done has perhaps received more notice in the United States than in this country which is only now beginning to realize the importance of rheumatic research

The public is apt to look for immediate and striking results as soon as any scheme of research is begun but

Open Endotracheal Anaesthesia in Infants

SIR,—In the *Journal* of November 20 (p 1025) there is an account, by Dr L T Clarke of Birmingham, of a new anaesthetic appliance for anaesthetizing infants I wish to point out that the technique of endotracheal anaesthesia without expiratory valve and rebreathing bag and open to the air has been in continuous use at the Babies Hospital Newcastle upon-Tyne for over two years A description of the T-piece and other details was published in the *British Journal of Surgery* in July 1937 and a more detailed paper appears in the current number of *Current Researches in Anesthesia and Analgesia* published in the United States by the International Anaesthesia Research Society

I am particularly interested in Dr Clarke's version of the "open" endotracheal technique because in February of this year I received an invitation to visit Birmingham and anaesthetize two cases for Mr W E M Wardill and Mr T Pomfret Kilner at the Queen's Hospital The operations were pharyngoplasty and the repair of cleft palate in an infant of 15 months and repair of a hare lip in a baby of about 4 weeks In addition to the surgical demonstration by Mr Kilner and Mr Wardill, I demonstrated my open endotracheal method for anaesthetizing babies to Dr Clarke, Dr McCardie Dr Featherstone, and other anaesthetists Although I am responsible for introducing to Birmingham the technique so ably described by Dr Clarke I would prefer to describe the method as a modification of the inhalational endotracheal technique devised by Dr Ivan Magill—I am etc,

Newcastle upon Tyne Nov 20 PHILIP AYRE

Combustion of Potassium Chlorate Tablets

SIR—A few years ago a warrant officer in the Royal Navy, while riding a motor bicycle came into collision with a motor car, and sustained minor bony injuries and burning He had been taking potassium chlorate tablets for a sore throat, and these tablets were in a cardboard box in his pocket After the collision the area around his pocket burst into flames and he was severely burnt Another accident that occurred only a few weeks ago was to a patient of mine who on getting into his car and sitting down suddenly heard a hissing noise in his waistcoat pocket, and found himself on fire He noticed two tablets of potassium chlorate which he had bought fall to the ground in flames and set alight the seat of his car He states that twenty-five tablets were in a paper packet, and so far as he knew there were no matches in his pocket, but he is not quite certain If a safety match box was there the potassium chlorate tablets in contact with the phosphorus of the lighting part of the box may have ignited but he is still confident that the tablets were not loose in his pocket, but were wrapped in paper It would be interesting to learn whether spontaneous combustion can occur I should be glad to know if anyone has any explanation to offer and I feel a public warning to motorists should be issued on the dangers of an accident due to potassium chlorate tablets

Pharmacists realize the combustible nature of potassium chlorate when friction is excited between this substance and phosphorus and for this reason are in the habit of instructing their clients in the careful handling of potassium chlorate tablets It is a simple matter to demonstrate this danger by striking one of these tablets on the friction paper of a box of safety matches The paper which contains phosphorus causes friction and the tablet is seen to flame up In the same way sufficient flame can be made by the tablets, on rubbing them against the head of a red match, to set the match on fire Should these tablets of potassium chlorate be loose in the pocket, friction and to some extent detonation coupled with the heat of the pocket will cause a fierce flame if the tablets are in contact with loose red matches or a safety box The chemical nature of potassium chlorate is such that it readily gives up its oxygen which will assist in feeding the flame in the process phosphorus pentoxide is formed ($5KClO_3 + 6P = 5KCl + 3P_2O_5$)

Severe burns have been caused however, when the patient has had no matches or anything of a phosphoric nature in his pocket It appears that in the presence of any small amount of organic matter and under the influence of detonation or friction the potassium chlorate will burst into flames It is therefore possible, despite the fact that the tablets are enclosed in a cardboard box that they may be fired while walking or driving and any grit or organic matter present in one's pocket will cause damage In the presence of acid such as one might get from acid drops etc., these potassium chlorate tablets will be broken down into chloric acid ($HClO_3$) Even the weak hydrofluosilicic acid will break down the potassium chlorate into chlorate acid ($2KClO_3 + H_2SiF_6 = 2HClO_3 + K_2SiF_6$) In its chemical properties this acid bears a strong resemblance to nitric acid but it is more easily decomposed being a very powerful oxidizing agent a drop of it will set fire to paper and it oxidizes phosphorus with explosive violence Potassium chlorate is also used in the making of detonators and explosives—I am etc.,

Hastings Nov 16 E F ST JOHN LYBURN

*** An accident of the same kind was recorded by Dr J Pereira Gray of Exeter in the *Journal* of November 23, 1929 (p 992) It is evident that a warning needs to be reissued from time to time Some responsible manufacturers print a caution on the label of packets containing chlorate of potash tablets advising the public not to carry these loose in the pocket and to keep them away from matches—ED *B M J*

Gastroscopy

SIR,—I was interested to read the report of the meeting of the Royal Academy of Medicine in Ireland on gastroscopy I would like to emphasize that it is as difficult to diagnose the presence of early malignant change in an ulcer by gastroscopy as it is with the naked eye and thus too much reliance should not be placed on a single examination With regard to the anaesthesia I have found that euphagin tablets which are sucked cause less discomfort to the patients than painting the palate and pharynx with decicain This tip was given to me by Mr Rodgers and Dr Hancock of St Bartholomew's

I cannot agree with Mr F J Smyth when he states that the instrument is especially valuable in the diagnosis of jejunal ulcer as the gastro-enterostomy stoma often lies in the blind spot I have been able to see the stoma in six of nine cases with a gastro-enterostomy and only two ulcers at the anastomosis although two others had been demonstrated radiologically The use of the prograde gastroscope as used in Professor Henning's clinic would increase considerably the number of stomas seen The passage of a gastroscope to the majority of patients is not an ordeal as suggested by Dr Alan Thompson though to a highly nervous patient, and to my one medical patient it was described as uncomfortable but not actually painful ("a little Teutonic perhaps") but in retrospect not so bad as he had anticipated
